This State Performance & Best Practices for the Prevention and Reduction of Underage Drinking Report (SPBP) is required by the Sober Truth on Preventing (STOP) Underage Drinking Act (Pub. L. 109-422), which was enacted by Congress in 2006 and reauthorized in December 2016 as part of the 21st Century Cures Act (Pub. L. 114-255). The STOP Act directs the Secretary of the Department of Health and Human Services (HHS), working with the Interagency Coordinating Committee on the Prevention of Underage Drinking (ICCPUD), chaired by the Assistant Secretary for Mental Health and Substance Use, U.S. Department of Health and Human Services, to develop a set of performance measures for evaluating the states’ use of best practices in preventing underage drinking.

To meet this requirement, the SPBP Report currently identifies 26 policies that are deemed known or potential best practices and provides a summary of the current status of adoption of these measures across the states. Further, it summarizes state and District of Columbia responses to an annual survey about underage drinking enforcement practices, prevention programs, and expenditures. Finally, it includes state and national data on alcohol-related outcomes for six performance measures.

**Time period covered by the 2020 SPBP:** State legal data reflect the status of the law as of January 1, 2019. State survey data, collected in 2019, were drawn from the most recent 12-month period in which the states maintained the data. Data presented in the six performance measures were drawn from the Substance Abuse and Mental Health Administration’s National Survey on Drug Use and Health (NSDUH) estimates for 2017–18, and from 2018 data from the National Highway Traffic Safety Administration’s Fatality Analysis Reporting System (FARS).

Introduction

The harmful consequences of underage drinking are widespread and affect individuals under age 21 as well as their families and their communities. The role of the states in preventing underage drinking is critical, particularly as regulators of the alcohol market. State legislatures adopt laws that regulate, directly or indirectly, underage alcohol use and availability in many ways, including the use of false identification, drivers licenses for young people, and adult responsibility for underage access. Enforcement of underage drinking laws and regulations takes place at the state and local level. State substance misuse agencies develop and support prevention, treatment, and recovery programs and activities in communities and schools. In many states and cities, public health agencies are involved in monitoring alcohol and drug use and are helping design and evaluate effective community-based prevention strategies as well.

Congress recognized the essential function that states play in the national efforts to reduce underage drinking when it enacted the Sober Truth on Preventing Underage Drinking (STOP) Act (Pub. Law 109-422; reauthorized in 2016 as part of the 21st Century Cures Act [Pub. Law 114-255]). The Act’s preamble includes this statement of the sense of Congress:

Alcohol is a unique product and should be regulated differently than other products by the States and Federal Government. States have primary authority to regulate alcohol distribution and sale, and the Federal Government should support and supplement these State efforts. States also have a responsibility to fight youth access to alcohol and reduce underage drinking. Continued State regulation and licensing of the manufacture, importation, sale, distribution, transportation, and storage of alcoholic beverages are … critical to … preventing illegal access to alcohol by persons under 21 years of age.

The STOP Act states that a “multi-faceted effort” and a “coordinated approach” to addressing underage drinking are needed. The key activities included in this approach are prevention, intervention, treatment, enforcement, and research and are reliant on multiple entities for execution (Exhibit I.1).

This document—State Performance & Best Practices for the Prevention and Reduction of Underage Drinking Report (SPBP Report)—is intended to provide guidance to decision-makers about how to identify and select the intervention(s) that will best serve their state or community, as required by the
STOP Act. The report also provides measures of states’ use of best practices in preventing under age drinking, as required by the STOP Act.

Chapter 1 of the document describes 26 state legal policies deemed known or potential best practices in preventing and reducing under age drinking and lists the current research supporting their level of effectiveness. In Chapter 2, the role of enforcement in successfully implementing these policies is discussed. Chapter 3 presents detailed summary data on the states’ enforcement and prevention activities, taken from an annual survey of the states. Finally, Chapter 4 provides charts showing state performance as measured by federal data for six key areas: (1) Underage past-month alcohol use, (2) past-month binge alcohol use, (3) perception of risk of excessive alcohol use, (4) prevalence of alcohol use disorder, (5) receipt of treatment for alcohol use disorder, and (6) traffic crash fatalities involving under age drivers with a blood alcohol content (BAC) greater than zero.

The STOP Act

The STOP Act directs the Secretary of the Department of Health and Human Services (HHS), working with the Interagency Coordinating Committee on the Prevention of Underage Drinking (ICCPUD), to develop a set of performance measures for evaluating the states’ use of best practices in preventing under age drinking (Section 2(c)(2)). The Act requires the following categories to be considered in developing such measures:

“(I) Whether or not the State has comprehensive anti-underage drinking laws such as for the illegal sale, purchase, attempt to purchase, consumption, or possession of alcohol; illegal use of fraudulent ID; illegal furnishing or obtaining of alcohol for an individual under 21 years; the degree of strictness of the penalties for such offenses; and the prevalence of the enforcement of each of these infractions.

“(II) Whether or not the State has comprehensive liability statutes pertaining to under age access to alcohol such as dram shop, social host, and house party laws, and the prevalence of enforcement of each of these laws.

“(III) Whether or not the State encourages and conducts comprehensive enforcement efforts to prevent under age access to alcohol at retail outlets, such as random compliance checks and shoulder tap programs, and the number of compliance checks within alcohol retail outlets measured against the number of total alcohol retail outlets in each State, and the result of such checks.

“(IV) Whether or not the State encourages training on the proper selling and serving of alcohol for all sellers and servers of alcohol as a condition of employment.

“(V) Whether or not the State has policies and regulations with regard to direct sales to consumers and home delivery of alcoholic beverages.

“(VI) Whether or not the State has programs or laws to deter adults from purchasing alcohol for minors; and the number of adults targeted by these programs.

“(VII) Whether or not the State has programs targeted to youths, parents, and caregivers to deter under age drinking; and the number of individuals served by these programs.

“(VIII) Whether or not the State has enacted graduated drivers licenses and the extent of those provisions.

1 The material in this report is not intended as legal advice and is not a substitute for the services of a practicing attorney. Those in need of information about the application of law to their circumstances are encouraged to consult a qualified attorney.
“(IX) The amount that the State invests, per youth capita, on the prevention of underage drinking, further broken down by the amount spent on--

“(aa) compliance check programs in retail outlets, including providing technology to prevent and detect the use of false identification by minors to make alcohol purchases;

“(bb) checkpoints and saturation patrols that include the goal of reducing and deterring underage drinking;

“(cc) community-based, school-based, and higher-education-based programs to prevent underage drinking;

“(dd) underage drinking prevention programs that target youth within the juvenile justice and child welfare systems; and

“(ee) other State efforts or programs as deemed appropriate.”

To meet this requirement, the SPBP Report currently identifies 26 policies that are deemed known or potential best practices and provides a summary of the current status of adoption of these measures across the states. Further, it summarizes state and District of Columbia (hereinafter collectively referred to as “the states”) responses to an annual survey about underage drinking enforcement practices, prevention programs, and expenditures.

The STOP Act also requires an annual report on each state’s performance in enacting, enforcing, and creating laws, regulations, and programs to prevent or reduce underage drinking. To meet this requirement, a report has been created for each of the states; the 2020 State Reports – Underage Drinking Prevention and Enforcement (2020 State Reports) are available at stopalcoholabuse.gov.

The SPBP Report is intended to help put the 51 individual State Reports in a national context.

Prevention and the Continuum of Care

The STOP Act provides guidelines for evaluating states’ efforts to prevent and reduce underage drinking. Prevention exists as part of a continuum of care that also includes treatment and recovery support for those youth who meet the diagnostic criteria for having a serious alcohol use disorder. As formulated by the Institute of Medicine (IOM),3 the continuum of care model (IOM, 1994; National Research Council [NRC] & IOM, 2009; Substance Abuse and Mental Health Services Administration [SAMHSA], 2018) encompasses the following elements:

- **Promotional** strategies to: (1) Create conditions supportive of behavioral health and (2) to reinforce the entire continuum of behavioral health services;
- **Prevention** interventions to prevent or reduce the risk of developing a behavioral health problem;
- **Treatment** services for those diagnosed with a substance use disorder or another disorder; and
- **Recovery** services to support the ability of individuals in recovery to live productive lives and to continue abstaining from substance use.

---

2 The STOP Act also requires the Secretary of HHS and ICCPUD to produce an annual Report to Congress on the Prevention and Reduction of Underage Drinking (RTC), which provides national data on underage drinking and describes federal prevention activities. The current RTC is available at stopalcoholabuse.gov.

3 Now the National Academy of Medicine within the National Academies of Sciences, Engineering, and Medicine.
Implicit in the description of a continuum is the understanding that some elements may overlap. For example, promotion and prevention strategies may share similar approaches (SAMHSA, 2018; NRC & IOM, 2009; National Academies of Sciences, 2019). Together, these elements must be seen as part of a comprehensive approach to the problem of underage alcohol consumption. Further, prevention of underage drinking should be understood as influencing the risk of excessive alcohol use (e.g., binge drinking) and the development of substance use disorders throughout the lifespan. Because early initiation of alcohol use is associated with the development of an alcohol use disorder later in life, and binge drinking by youth is strongly associated with binge drinking by adults, the use of effective prevention strategies for underage drinking can have a long-term effect on the entire continuum of care and help reduce the economic cost of excessive alcohol use and related harms in the United States, which was estimated to be $249 billion ($2.05 per drink) in 2010 (Hingson & Zha, 2009; Edwards et al., 2015; Flewelling et al., 2013; Sacks et al., 2015; Holder, 2002).

It is also important to recognize that the drinking behavior of adults can have a substantial effect on the drinking behavior of youth (Nelson et al., 2009; 2005). Drinking by underage youth (e.g., high school students) is strongly correlated with drinking by adults living in the same state, and the drinking behavior of both youth and adults is strongly influenced by state alcohol control policies (Nelson et al., 2009; Xuan et al., 2015). At an individual level, a recent analysis of a longitudinal study noted that parental attitudes and monitoring of drinking behavior influenced emerging adults’ risky drinking behavior (e.g., driving while intoxicated, riding with an intoxicated driver, blackouts from binge drinking). The authors noted prevention programs that focus on binge drinking and bolster parental practices may reduce the likelihood of later major alcohol-related health-risk behaviors and their consequences (Vaca et al., 2020). These findings underscore both the influence of parental modeling and parental oversight, as well as the need to implement evidence-based alcohol policies that have been found to effectively reduce excessive drinking, including among adults and any underage drinking.

Many of the most effective interventions for reducing youth drinking are universal interventions that also reduce the drinking behavior of adults (e.g., increasing alcohol taxes, regulating alcohol outlet density). Therefore, a comprehensive approach to preventing underage drinking that also emphasizes the prevention of excessive drinking (e.g., binge drinking) by adults is likely to have the greatest impact on reducing underage drinking and related harms (SAMHSA, 2019; The Guide to Community Preventive Services (The Community Guide: www.thecommunityguide.org/alcohol).

**Identifying and Implementing Statewide Policies**

Research indicates that effective prevention initiatives must be both multi-level (coordinating efforts among governments and agencies) and multi-faceted (employing both environmental and

---

4 It is estimated that reducing alcohol use among youth ages 12–17 alone could result in an overall savings of $52.9 billion. This estimate was derived from the product of: (1) The number of high-school–aged youth ages 12–17 years old in 2016 (25.01 million) and (2) the per-participant benefit (from implementing effective nationwide prevention programming for school-aged children and youth) minus cost associated with alcohol. The estimate was reduced by 25 percent to account for reduced intervention effectiveness as the implementation moves from demonstration to full implementation (Greenwood et al., 1996; Miller and Levy, 2000; Aos et al., 1999). Assumptions: Only savings from existing school-based programs are included in these estimates. Cost savings accrue over a multi-year period. Future costs were converted to present value using a 3 percent discount rate. Costs due to youth substance misuse decline at the same rate as the number of initiators.

5 Youth drinking refers to consumption of alcohol by those under the age of 21.
individual-level approaches; Edwards, 2015; Flewelling et al., 2013; Holder, 2002). Prevention strategies must also be targeted strategically. The IOM describes three categories of prevention interventions: (1) Universal (aimed at all members of a given population), (2) selective (aimed at a sub-group determined to be at high risk for substance use), and (3) indicated (targeted to individuals who are already using substances but have not developed a substance use disorder; NRC & IOM, 2009). As noted in the 2016 Surgeon General’s Report, *Facing Addiction in America: The Surgeon General’s Report on Alcohol, Drugs, and Health*, “…research has not yet been able to suggest an optimal mix” (HHS, 2016).

As the Surgeon General’s Report states (HHS, 2016), the choices as to where to target a strategy are not always clear cut:

> Communities may think it is best to direct services only to those with the highest risk and lowest protection or to those already misusing substances. However, a relatively high percentage of substance misuse-related problems come from people at lower risk, because they are a much larger group within the total population than are people at high-risk. This follows what is known as the Prevention Paradox: “a large number of people at a small risk may give rise to more cases of disease than the small number who are at a high risk.” By this logic, providing prevention interventions to everyone (i.e., universal interventions) rather than only to those at highest risk is likely to have greater benefits.

Given these complexities, communities and governments wishing to address underage drinking prevention are faced with multiple choices that must be appropriate to the specifics of their community and workable within the limits of their resources. Considerations must include whether specific interventions are culturally appropriate, especially when targeted toward diverse populations, or whether adaptations are necessary. Further, adaptations of an evidence-based intervention must be measured against preservation of the fidelity of the intervention (HHS, 2016). A strategy is only as effective as its implementation allows. Therefore, researchers stress that evaluation of the implementation process is a key component to putting any evidence-based strategies and programs into practice, and that both ensuring fidelity and adaptation (when appropriate) are critical to the ultimate effectiveness of the program (Fixsen et al., 2005; HHS, 2016).

Implementation has been defined as a specified set of activities designed to put into practice an activity, policy, or program (Fixsen et al., 2005). It requires “deliberate and strategic efforts to facilitate collaboration, communication, and relationship-building among researchers, implementers, and policymakers” (Sturke et al., 2014). Similarly, sustainable implementation is supported by “a bi-directional model, where researchers work with, and learn from, people on the ground rather than coming to dictate what will be done” (Fogarty International Center, 2013).

Researchers have suggested guidelines for promoting state and national policies to implement transformative human services practices and programs that are particularly relevant to the best practices discussed in Chapter 1 of this document:

1. Policymakers and planners need to build knowledge of implementation into policies and guidelines that impact human services.
2. Governments need to invest in the development and use of implementation strategies and methods that are grounded in research and elaborated through accumulated experience.
3. Funding strategies are critical to implementation of well-defined practices and programs (Fixsen et al., 2005).
A significant component of successful policy implementation is the capacity to enforce the policies once they are in effect. Enforcement is the sum total of actions taken by public entities to increase compliance. Laws may or may not specify sanctions or enforcement practices. Enforcement and compliance of alcohol policies is discussed in greater detail in Chapter 2.

**Framework of State Performance and Best Practices**

Chapter 1 describes 26 state policies deemed to be known or potential best practices in preventing and reducing underage drinking. It also includes the status of adoption of these policies by the states. Most of these policies were included in original STOP Act legislation or were recommended by Congress during the 2009–10 appropriations process.

Chapter 2 discusses the significance of enforcement in underage drinking prevention. As noted above, implementation of many policies, including prohibitions on underage possession, consumption, or purchase of alcohol is largely synonymous with enforcement. A significant component of the STOP Act’s mission is to collect data and report on each state’s performance in enforcing policies designed to prevent or reduce underage drinking.

Chapter 3 provides an analysis of responses to the 2019 STOP Act State Survey, an annual survey on the states’ enforcement and prevention activities. This includes findings on the states’ environmental and individual-level strategies for addressing underage drinking.

Chapter 4 provides data on how the states compare to national averages for six key performance measurements related to prevention and treatment of underage drinking. These measures have been identified by the ICCPUD as significant for purposes of evaluating progress in underage drinking prevention.

It should be noted that the best practices described here are primarily environmental. That is, they seek to alter physical, economic, and social environments, which may be focused on entire populations or a sub-population. The main mechanisms for environmental change include state laws and local ordinances and their enforcement, institutional policies, and changing norms. In contrast, individual-level approaches include programs designed to impart knowledge, change attitudes and beliefs, or teach skills to youth and adults. Individual-level best practices for prevention, treatment, and recovery are discussed in the 2016 Surgeon General’s Report, as well as environmental-level best practices (HHS, 2016). The State Reports also describe many of the individual-level programs being used in each state.

---

6 Each state’s complete survey response is included in its State Report, described above.
CHAPTER 1

Best Practices—
State Prevention Policies
CHAPTER 1: BEST PRACTICES—STATE PREVENTION POLICIES

Introduction

Fundamentally, a best practice can be defined as “an intervention that has shown evidence of effectiveness in a particular setting and is likely to be replicable to other situations” (Ng & de Colombani, 2015). Such interventions are validated as evidence-based practices (EBPs) through documented scientific testing for efficacy, as opposed to reliance on convention, tradition, folklore, personal experience, belief, intuition, or anecdotal evidence.

Despite broad agreement regarding the need for EBPs, there is currently no consensus on the precise definition of an EBP. Disagreement arises not from the need for evidence but from the kind and amount of evidence required for validation. The gold standard of scientific evidence is the randomized controlled trial, but it is not always possible to conduct such trials. Many strong, widely used, quasi-experimental designs have produced and will continue to produce credible, valid, and reliable evidence—these should be relied on when randomized controlled trials are not possible. Practitioner input is a crucial part of this process and should be carefully considered as evidence is compiled, summarized, and disseminated to the field for implementation.

The Institute of Medicine,7 for example, defined an EBP as one that combines the following three factors: Best research evidence, best clinical experience, and consistency with patient values (IOM, 2001). The American Psychological Association (APA) adopted a slight variation of this definition for the field of psychology, as follows: EBP is “the integration of the best available research with clinical expertise in the context of patient characteristics, culture, and preferences” (APA Presidential Task Force on Evidence-Based Practice, 2006).

The federal government does not provide a single, authoritative definition of EBPs, yet the general concept of an EBP is clear: Some form of scientific evidence must support the proposed practice, the practice itself must be practical and appropriate given the circumstances under which it will be implemented and the population to which it will be applied, and the practice must have a significant effect on the outcome(s) to be measured.

This chapter therefore focuses on 26 underage drinking prevention policies that have been identified as best practices or as promising practices suitable for ongoing evaluation. These prevention policies, for which there is mixed, promising, or strong evidence of effectiveness, fall into four categories, including those addressing: (1) underage possession or purchase of alcohol, (2) underage drinking and driving, (3) alcohol availability, and (4) alcohol pricing. Seventeen of these policies were included in original Sober Truth on Preventing Underage Drinking (STOP) Act legislation or in Congressional report language during the 2009–10 appropriations process. The remaining nine policies were added by the Interagency Coordinating Committee on the Prevention of Underage Drinking (ICCPUD) following input from various stakeholders and review of the relevant literature.

---

7 Now the National Academy of Medicine within the National Academies of Sciences, Engineering, and Medicine.
Each of the underage drinking prevention policies analyzed below was determined to be a best or potential best practice by ICCPUD. Additionally, the majority of these policies were identified as best practices by one or more of the following five sources:

2. The Surgeon General (The Surgeon General’s Call to Action to Prevent and Reduce Underage Drinking; Department of Health and Human Services [HHS], 2007).

The 26 policies are listed in Exhibit 1.1. An “X” indicates that a given policy is identified as a best practice by ICCPUD and one or more of the five sources listed above.

Research on each policy’s effectiveness for reducing underage drinking is included after each policy description. It is important to note that the data supporting each of the 26 policies are different. Some policies find greater or lesser support in research literature and in the source documents. Each policy summary describes the policy’s key components, the status of the policy across states, and trends over time.

Policies Addressing Underage Possession or Purchase of Alcohol

Underage Possession, Consumption, and Internal Possession

Policy Description
As of January 1, 2019, all states prohibit possession of alcoholic beverages (with certain exceptions) by those under age 21. In addition, most jurisdictions have statutes that specifically prohibit the consumption of alcoholic beverages by those under age 21.

In recent years, a number of jurisdictions have enacted laws prohibiting “internal possession” of alcohol by persons under 21. These provisions typically require evidence of alcohol in the minor’s body, but do not require any specific evidence of possession or consumption. Internal possession laws are especially useful to law enforcement in making arrests or issuing citations when breaking up underage drinking parties. Internal possession laws allow officers to bring charges against underage individuals who are neither holding nor drinking alcoholic beverages in the presence of law enforcement officers.

Exceptions
Some jurisdictions allow exceptions to possession, consumption, or internal possession prohibitions when a family member consents or is present. Jurisdictions vary widely in terms of which relatives may consent or must be present for this exception to apply and in what circumstances the exception applies. Sometimes a reference is made simply to “family” or “family member” without further elaboration.

Some jurisdictions allow exceptions to possession, consumption, or internal possession prohibitions on private property. Jurisdictions vary in the extent of the private property exception, which may extend to all private locations, private residences only, or in the home of a parent or guardian only.

In some jurisdictions, a location exception is conditional on the presence or consent of a parent, legal guardian, or spouse (see Exhibit 1.2, “Exception for Both Together”). In other jurisdictions, both family and location exceptions exist and apply separately (see Exhibit 1.2, “Both Types of Exceptions”).

With respect specifically to consumption laws, some jurisdictions prohibit underage consumption on licensed premises only.

Status of Underage Possession Policies
As of January 1, 2019, all states prohibit possession of alcoholic beverages by those under age 21. Nineteen states do not have a family or location exception, 11 have family exceptions only, and five have location exceptions only. The remaining states have both types of exceptions, which in some states are conditional on each other and in some states apply separately (see Exhibit 1.2).

---

10 Note that throughout Chapter 1, jurisdictions include the 50 states and the District of Columbia.
Chapter 1: Best Practices–Evidence-Based Prevention Policies

Exhibit 1.2: Exceptions to Minimum Age of 21 for Possession of Alcohol as of January 1, 2019

Trends in Underage Possession Policies

Between 1998–2019, the number of jurisdictions with family exceptions rose from 23 to 27, the number with location exceptions rose from 20 to 21, and the number of jurisdictions with neither exception decreased from 21 to 19 (see Exhibit 1.3).

Status of Underage Consumption Policies

As of January 1, 2019, 36 jurisdictions prohibit consumption of alcoholic beverages by those under age 21. Of those, 15 permit no exception (see Exhibit 1.4). Seven states permit only family exceptions; three states permit only location exceptions. Twelve states had both types of exceptions, with ten of those states permitting underage consumption only if both family and location criteria are met.

Trends in Underage Consumption Policies

As Exhibit 1.5 illustrates, between 1998–2019, the number of jurisdictions that prohibit underage consumption under at least some circumstances increased from 27 to 36.
Exhibit 1.3: Number of States With Family and Location Exceptions to Minimum Age of 21 for Possession of Alcohol, January 1, 1998–January 1, 2019

Exhibit 1.4: Exceptions to Minimum Age of 21 for Consumption of Alcohol as of January 1, 2019
Status of Underage Internal Possession Policies

As of January 1, 2019, nine states prohibit internal possession of alcoholic beverages for anyone under age 21 (see Exhibit 1.6). Of the nine states that prohibit internal possession, three make exceptions for presence of family and/or location.

Trends in Underage Internal Possession Policies

As Exhibit 1.7 illustrates, between 1998–2019, the number of states that prohibit underage internal possession grew from two to nine. The most recent state to enact a prohibition on internal possession was Wyoming in 2010.

Underage Purchase and Attempted Purchase

Policy Description

Most states prohibit minors from purchasing or attempting to purchase alcoholic beverages. A minor purchasing alcoholic beverages can be prosecuted for possession because, arguably, a sale cannot be completed until there is possession on the part of the purchaser. Purchase and possession are nevertheless separate offenses. A minor who purchases alcoholic beverages could be liable for two offenses in states that have both prohibitions (see the “Underage Possession/Internal Possession/Consumption” policy above for further discussion). A significant minority of youth purchase or attempt to purchase alcohol for themselves, sometimes using falsified ID (see the “False ID” policy below).

Such purchases increase the availability of alcohol to underage persons, which, in turn, increases underage consumption. Prohibitions and associated sanctions on underage alcohol purchases can be expected to depress rates of and attempts to purchase by raising the monetary and social costs of this behavior. These laws provide a primary deterrent (preventing attempted purchases) and a secondary deterrent (reducing the probability that persons sanctioned under these laws will attempt to purchase in the future).

In some states, a person under age 21 is allowed to purchase alcoholic beverages as part of a law enforcement action. Most commonly, these actions are checks on merchant compliance or stings to identify merchants who illegally sell alcoholic beverages to minors. This allowance for purchase in the law enforcement context may exist even though a state does not have a law specifically prohibiting underage purchase.

Status of Underage Purchasing Policies

As of January 1, 2019, 45 states and the District of Columbia prohibit underage purchase or attempted purchase of alcohol; the remaining four states (Delaware, Indiana, New York, and Vermont) do not (see Exhibit 1.8). Underage persons are allowed to purchase alcohol for law enforcement purposes in 25 states including Indiana, even though Indiana does not have an underage purchase statute.

Trends in Underage Purchasing Policies

Between 1998–2018, the number of jurisdictions prohibiting underage purchase of alcohol had increased from 46 to 47, but, as of January 1, 2019, Oklahoma repealed its prohibition on Underage Purchase. Hence, the number is once again 46. The number of states with allowances for underage purchase for enforcement purposes has increased, from eight in 1998 to 25 in 2019 (Exhibit 1.9).

Some states have laws that specifically prohibit both underage purchase and attempted purchase of alcohol. An attempted purchase occurs when a minor takes concrete steps toward committing the offense of purchasing whether or not the purchase is consummated. Courts in states that include only the purchase prohibition in their statutes would likely treat attempted purchase as a lesser included offense. It can, therefore, be assumed that all states that prohibit purchase also prohibit attempted purchases. The two offenses are thus not treated separately in this report.
Exhibit 1.8: Underage Purchase of Alcohol for Law Enforcement Purposes as of January 1, 2019

APIS provides further descriptions of this policy and its variables, details regarding state policies, and a review of the limitations associated with the reported data.

False ID

Policy Description

Alcohol retailers are responsible for ensuring that sales of alcoholic beverages are made only to individuals who are legally permitted to purchase alcohol. Inspecting government-issued ID (i.e., driver’s license, non-driver ID card, passport, and military ID card) is one major mechanism for ensuring that buyers meet minimum age requirements. In attempting to circumvent these safeguards, minors may obtain and use apparently valid ID cards that falsely state their age as 21 or over. Age may be falsified by altering the birthdate on a valid ID card, obtaining an invalid ID card that appears to be valid, or using someone else’s ID card.

Compliance check studies suggest that underage people who drink may have little need to use false ID because retailers often make sales without any ID inspection. However, concerns about false ID remain high among educators, law enforcement officials, retailers, and government officials. Current technology, including high-quality color copiers and printers, has made false ID cards easier to fabricate, and the Internet provides ready access to a large number of false ID vendors.

All states prohibit use of false ID by minors to obtain alcohol. In addition to basic prohibitions, states have adopted a variety of legal provisions pertaining to false ID for obtaining alcohol. These can be divided into three basic categories:

1. Provisions that target minors who possess and use false ID cards to obtain alcohol.
2. Provisions that target those who supply minors with false ID cards, either through lending of a valid ID card or production of invalid (“fake”) ID cards.
3. Provisions that assist retailers in avoiding sales to potential buyers who present false ID cards. For further discussion of policies pertaining to the purchase of alcohol by minors, see the “Underage Purchase and Attempted Purchase” policy above; for policies that mandate training of servers to detect false ID, see the “Responsible Beverage Service” policy below; and for policies on license suspension or revocation, see the “Loss of Driving Privileges for Alcohol Violations by Minors” policy below.

Status of False ID Policies

Provisions That Target Minors

As of January 1, 2019, all states and the District of Columbia prohibit minors from using false ID cards to obtain alcohol. Forty-one jurisdictions authorize suspension of minors’ driver’s licenses for using false ID in the purchase of alcohol through judicial proceedings, administrative proceedings, or both (see Exhibit 1.10).
Exhibit 1.10: Procedure for Imposing License Sanction for Use of False ID as of January 1, 2019

Exhibit 1.11: Number of States With Scanner Provisions in False ID Laws, January 1, 1998–January 1, 2019
Provisions That Target Suppliers

As of January 1, 2019, 25 states have laws that target suppliers of false ID cards; 24 prohibit lending, transferring, or selling false ID cards to minors for the purpose of purchasing alcohol; and 13 prohibit manufacturing such IDs.

Provisions That Support Retailers

Retailer support provisions vary widely across the states. In prosecutions involving an illegal underage alcohol sale, 44 states and the District of Columbia provide for some type of affirmative defense (e.g., the retailer shows that he/she reached a good faith or reasonable conclusion that the false ID was valid); 42 states have laws requiring distinctive licenses for persons under age 21; 12 states permit retailers to seize apparently false IDs; 11 states provide incentives for the use of scanners (see Exhibit 1.11); four states (Arkansas, Colorado, South Dakota, and Utah) allow retailers to detain minors; and five states (Alaska, New Hampshire, Oregon, Utah, and Wisconsin) permit retailers to sue minors for damages.

Trends in False ID State Policies

State false ID policies that target minors and suppliers have been relatively stable since 1998. Between 2014–15, Indiana and Georgia eliminated their license suspension penalties.

Data Sources and Citations

Chapter 1: Best Practices—Evidence-Based Prevention Policies

Policies Targeting Underage Drinking and Driving

Youth BAC Limits (Underage Operators of Non-Commercial Motor Vehicles)

Policy Description

BAC limit policies establish the maximum amount of alcohol a minor can have in his or her bloodstream when operating a motor vehicle. BAC is commonly expressed as a percentage. For instance, a BAC of 0.08 percent means that a person has 8 parts of alcohol per 10,000 parts blood in the body. State laws generally specify BAC levels in terms of grams of alcohol per 100 milliliters of blood (often abbreviated as grams per deciliter, or g/dL). BAC levels can be detected by breath, blood, or urine tests. The laws of each jurisdiction specify the preferred or required types of tests used for measurement.

There is strong scientific evidence that, as BAC increases, the cognitive and motor skills needed to operate a motor vehicle are increasingly impaired. BAC statutes establish criteria for determining when the operator of a vehicle is sufficiently impaired to constitute a threat to public safety and is, therefore, violating the law. Currently, 49 states and the District of Columbia mandate a BAC limit of 0.08 g/dL for drivers over age 21. In 2018, Utah became the first state to lower the BAC limit to 0.05 g/dL.

Underage drivers’ ability to safely operate a motor vehicle may be impaired at a lower BAC than that of adults because of lower body mass, lack of physiological development, and lack of driving experience. Partly as a result of financial incentives established by the federal government, all jurisdictions in the United States have enacted low BAC limits for underage drivers. Laws establishing very low legal BAC limits of 0.02 g/dL or less for drivers under the legal drinking age of 21 are widely referred to as zero-tolerance laws.

A per se BAC statute stipulates that if the operator has a BAC level at or above the per se limit, a violation has occurred without regard to other evidence of intoxication or sobriety (e.g., how well or poorly the individual is driving). In other words, exceeding the BAC limit established in a per se statute is itself a violation.

Status of Youth BAC Limit Policies

As of January 1, 2019, all states have per se youth BAC statutes. Thirty-four states set the driving BAC limit for underage persons at 0.02 g/dL (see Exhibit 1.12). Fourteen states and the District of Columbia consider any underage alcohol consumption while driving to be a violation of the law and have set the limit to 0.00 g/dL. Two states (California and New Jersey) have set the underage BAC limit to 0.01 g/dL.

Trends in Youth BAC Limit Policies

Since 1998, all states have had zero tolerance (0.02 g/dL or lower) youth BAC limit laws (see Exhibit 1.13). In the period between 1999–2019, the number of states mandating specific BAC limits for underage drivers remained constant with the exception of one state (Maryland), which lowered its underage BAC limit from 0.02 to 0.00 g/dL.

Loss of Driving Privileges for Alcohol Violations by Minors (“Use/Lose” Laws)

Policy Description
Use/lose laws authorize suspension or revocation of driving privileges as a penalty for underage purchase, possession, or consumption of alcoholic beverages. States began enacting these statutes in the mid-1980s to deter underage drinking by imposing a punishment that young people would consider significant: The loss of a driver’s license. In most states, use/lose laws make it mandatory to impose driver’s license sanctions in response to underage alcohol violations. State laws vary as to the type of violation (purchase, possession, or consumption of alcohol) that leads to these sanctions and how long suspensions or revocations stay in effect. State laws specific to minors (purchase, possession, and consumption of alcoholic beverages) are described in the “Underage Purchase of Alcohol” and “Underage Possession / Consumption / Internal Possession of Alcohol” policies.

Status of Loss of Driving Privileges Policies
Thirty-six states and the District of Columbia have made license suspension or revocation mandatory or discretionary in cases of underage alcohol violations. Fourteen states have no use/lose laws.

Upper Age Limits
Twenty-five states and the District of Columbia set age 21 as the upper limit for which use/lose laws apply. Ten states set the upper limit at age 18, and one state (Wyoming) set the limit at age 19. In four states (Arkansas, Hawaii, Tennessee, and Virginia), some sanction conditions vary depending on whether the violator is under age 18 or under age 21.

Authority to Impose License Sanctions
In the vast majority of jurisdictions with use/lose laws (28 states and the District of Columbia), license suspension or revocation is mandatory (see Exhibit 1.14). Eight states have made this a discretionary penalty for such violations. Among all the states with use/lose laws, two states (Arkansas and Hawaii) have a discretionary penalty for minors below age 18 but mandatory for violators ages 18–20.

Trends in Loss of Driving Privileges Policies
Between 1998–2019, the number of jurisdictions that made license suspension or revocation mandatory in at least some cases of underage alcohol violations increased from 25 to 29 (see Exhibit 1.15). Arkansas and Hawaii are counted as both mandatory and discretionary in this exhibit. During this period, the number of jurisdictions with no use/lose laws decreased from 17 to 14.

Chapter 1: Best Practices—Evidence-Based Prevention Policies

Graduated Driver’s Licenses

Policy Description

Graduated driver licensing (GDL) is a system designed to delay full licensure for teenage automobile drivers, thus allowing beginning drivers to gain experience under less-risky conditions. Teenagers are targeted because they are at the highest risk for motor vehicle crashes, including alcohol-related crashes. By imposing restrictions on driving privileges, GDL reduces the chances of teenagers driving while intoxicated.

A fully developed GDL system has three stages: (1) A minimum supervised learner’s period, (2) an intermediate license (once the driving test is passed) that limits unsupervised driving in high-risk situations, and (3) a full-privilege driver’s license after completion of the first two stages. Beginners must remain in each of the first two stages for set minimum time periods.

The learner’s stage has three components:
1. Minimum age at which drivers can operate vehicles in the presence of parents, guardians, or other adults.
2. Minimum holding periods during which learner’s permits must be held before drivers advance to the intermediate stage of the licensing process.
3. Minimum age at which drivers become eligible to drive without adult supervision.

The intermediate stage of GDL law has five components:
1. Minimum age at which drivers become eligible to drive without adult supervision.
2. Unsupervised night-driving prohibitions.
3. Primary enforcement of night-driving provisions.
4. Passenger restrictions, which set the total number of passengers allowed in vehicles driven by intermediate-stage drivers.
5. Primary enforcement of passenger restrictions.

“Primary enforcement” refers to the authority given to law enforcement officers to stop drivers for the sole purpose of investigating potential violations of night-driving or passenger restrictions. Law enforcement officers in states without primary enforcement can investigate potential violations of these provisions only as part of an investigation of some other offense. Primary enforcement greatly increases the chance that violators will be detected. The single component for the license stage of GDL is the minimum age at which full licensure occurs and both passenger and night-driving restrictions are lifted.

Status of GDL Policies

All 51 jurisdictions have some form of GDL policy, and all states have full three-stage criteria. The minimum age for each stage and the extent to which the other restrictions are imposed vary across jurisdictions. An important GDL provision related to traffic safety is the minimum age for full licensure. Full licensure is allowed by 15 jurisdictions on the 18th birthday; three

---

12 Note that the Centers for Disease Control and Prevention have developed a planning guide to assist states in assessing, developing, and implementing plans to strengthen graduated driver licensing practices, which can be viewed at https://www.cdc.gov/motorvehiclesafety/pdf/teen/gdl_planning_guide-a.pdf.

13 Additional information about the status of state GDL policies can be found at https://wwwn.cdc.gov/psr/NationalSummary/NSMVI.aspx.
jurisdictions permit full licensure above age 17 but under age 18; and 17 jurisdictions permit full licensure on the 17th birthday (see Exhibit 1.16). The remaining 16 jurisdictions permit full licensure to those who are under 17 but at least 16 years old. All but one jurisdiction have night-driving restrictions.¹⁴ Forty-seven jurisdictions place passenger restrictions on drivers with less than full licensure.

**Exhibit 1.16: Minimum Age of Full Driving Privileges Laws as of January 1, 2019**

<table>

<tr>
<th>At Least 18</th>
<th>Over 17 But Less Than 18</th>
<th>Age 17</th>
<th>At Least 16 But Less Than 17</th>
</tr>
</thead>
</table>

**Trends in GDL Policies**

On January 1, 1996, only one state (Maryland) had a three-stage GDL law. However, by 2000, 23 jurisdictions had enacted three-stage GDL laws, and by 2012, that number had risen to the current level of 51 (see Exhibit 1.17).

¹⁴ In 2016, 27 jurisdictions had GDL policies that restricted driving between the hours of 10:00 p.m. and 5:00 a.m., a timeframe when youth subject to GDL regulations are more likely to be driving. (https://www.cdc.gov/mmwr/volumes/65/wr/mm6529a1.htm).
Data Sources and Citations

Legal research for this topic is planned and managed by the Interagency Coordinating Committee on the Prevention of Underage Drinking (ICCPUD), chaired by Elinore F. McCance-Katz, M.D., Ph.D., Assistant Secretary for Mental Health and Substance Use, and is conducted under contract number HHSS277201500001C. Historical data for the years 1996–2004 were obtained from Chen, Baker, and Li (2006). Data from January 1, 2005–December 31, 2008, were obtained from the Insurance Institute for Highway Safety (https://www.iihs.org/topics/teenagers/graduated-licensing-laws-table).

Chapter 1: Best Practices–Evidence-Based Prevention Policies

Policies Targeting Alcohol Availability

Furnishing Alcohol to Minors

Policy Description
All states prohibit furnishing alcoholic beverages to minors by both commercial servers (bars, restaurants, retail sales outlets) and non-commercial servers. However, examination of case law would be required to determine with certainty that the prohibition applies to both commercial and non-commercial servers in all states. Additionally, most states include some type of exception (of the types listed below) to their furnishing laws.

Most underage persons obtain alcohol from adults, including parents, older siblings, peers, or strangers solicited to purchase alcohol for the minor. However, some underage persons purchase alcohol for themselves from merchants who fail to comply with laws prohibiting sale to minors or by using false ID (see the “False ID” policy). These sources increase the availability of alcohol to youth, which, in turn, increases underage consumption. Prohibitions and associated sanctions on furnishing to underage persons can be expected to depress rates of furnishing by raising the monetary and social costs of this behavior. Such laws provide a primary deterrent (preventing furnishing) and a secondary deterrent (reducing the chances of persons sanctioned under these laws furnishing in the future).

Two types of exceptions to underage furnishing laws are discussed in this analysis:
1. Family exceptions permit parents, guardians, or spouses to furnish alcohol to minors; some states specify that the spouse must be of legal age and others do not.
2. Location exceptions permit furnishing alcohol in specified locations and may limit the extent to which family members can furnish to minors. No state has an exception for furnishing on private property by anyone other than a family member.

Some states provide sellers and licensees with one or more defenses against a charge of furnishing alcoholic beverages to a minor. Under these provisions, a retailer who provides alcohol to a minor will not be found in violation of the furnishing law if he or she can establish one of these defenses. This policy topic tracks one such defense: Some states require that the minor who initiated a transaction be charged for possessing or purchasing the alcohol before the retailer can be found in violation of the furnishing law (see the “False ID” policy for information on defenses associated with minors using false ID). Many states also have provisions that mitigate or reduce the penalties imposed on retailers if they have participated in responsible beverage service (RBS) programs; see the “RBS” policy for further discussion.

In some states, furnishing laws are closely associated with laws that prohibit hosting underage drinking parties. These laws target hosts who allow underage drinking on property they own, lease, or otherwise control (see the “Hosting Underage Drinking Parties” policy for further discussion). Hosts of underage drinking parties who also supply the alcohol consumed or possessed by minors may be in violation of two distinct laws: (1) Furnishing alcohol to minors and (2) allowing underage drinking to occur on property they control.

Also addressed in this chapter are social host liability laws, which impose civil liability on hosts for injuries caused by their underage guests. Although related to party hosting laws, social host liability laws are distinct. They do not establish criminal or civil offenses but instead allow
injured parties to recover damages by suing social hosts of events at which minors consumed alcohol and later were responsible for injuries. The commercial analog to social host liability laws is dram shop laws, which prohibit commercial establishments—bars, restaurants, and retail sales outlets—from furnishing alcoholic beverages to minors. See the “Social Host Liability” and “Dram Shop Liability” policies for further discussion.

**Status of Underage Furnishing Policies**

**Exceptions to Furnishing Prohibitions**

As of January 1, 2019, all states prohibit the furnishing of alcoholic beverages to minors. Nineteen states and the District of Columbia have no family or location exceptions to this prohibition (see Exhibit 1.18). Nineteen states have only a family exception. The remaining 12 states have a family exception limited to certain locations, such as any private residence or the parents’ homes.

**Affirmative Defense for Sellers and Licensees**

As of January 1, 2019, the underage furnishing laws of two states (Michigan and South Carolina) include provisions requiring that a seller/licensee be exonerated of charges of furnishing alcohol to a minor unless the minor involved is also charged.

**Trends in Underage Furnishing Policies**

As of January 1, 1998, all states prohibited underage furnishing and still do so, although a few states have added exceptions since then (see Exhibit 1.19).

All data for the “Furnishing Alcohol to Minors” policy were obtained from the APIS website: https://alcoholpolicy.niaaa.nih.gov/apis-policy-topics/furnishing-alcohol-to-minors/40. APIS provides further descriptions of this policy and its variables, details regarding state policies, and a review of the limitations associated with the reported data.

Compliance Check Protocols

Policy Description

Compliance checks involve an underage operative (a “decoy”)—working either with local law enforcement officials or with agents from the state alcoholic beverage control (ABC) agency—who enters an alcohol retail establishment and attempts to purchase an alcoholic beverage from a server, bartender, or clerk.

Protocols for these compliance checks vary from state to state but in general follow a similar outline. An underage person (allowable ages vary by state) serves as a decoy. Decoys are generally instructed to act and dress in an age-appropriate manner. The decoy enters an alcohol retail outlet and attempts to purchase a predetermined alcohol product (e.g., a six-pack of beer at an off-sale establishment or a mixed drink at an on-sales establishment). Typically, an undercover enforcement officer from a local police department or the state ABC agency observes the decoy. Audio and video recording equipment may also be used or required. State rules vary regarding a decoy’s use of legitimate ID cards (e.g., driver’s licenses), although a few states allow decoys to verbally exaggerate their age. If a purchase is made successfully, the establishment and the clerk or server may be subject to an administrative or criminal penalty.

Most, but not all, states permit law enforcement agencies to conduct compliance checks on a random basis. A few states permit the checks only when there is a basis for suspecting that a particular licensee has sold alcohol to a minor in the past. To ensure that state and local law enforcement agencies are following uniform procedures, most states issue formal compliance check protocols or guidelines. If the protocols are not followed, then the administrative action against the licensee may be dismissed. The protocols are therefore designed to ensure that law enforcement actions are fair and reasonable and to provide guidelines to licensees for avoiding prosecution.

Compliance checks of off- and on-premises licensed alcohol retailers are an important community tool for reducing illegal alcohol sales to minors and promoting community normative change. The 2004 National Research Council (NRC)/IOM report, Reducing Underage Drinking: A Collective Responsibility (2004), calls for: (1) Regular, random compliance checks; (2) administrative penalties, including fines and license suspensions that increase with each offense; (3) enhanced media coverage for the purposes and results of compliance checks; and (4) training for alcohol retailers regarding their legal responsibility to avoid selling alcohol to underage youth. The 2016 Surgeon General’s Report on Alcohol, Drugs, and Health found that compliance checks are an effective strategy for reducing alcohol consumption by minors and can be implemented in conjunction with other population-level alcohol policies (HHS, 2016).

Compliance checks have both educational and behavior change goals:

1. Change or reinforce social norms that underage drinking is not acceptable by publicizing non-compliant retailers.
2. Educate the community—including parents, educators, and policymakers—about the ready availability of alcohol to youth, which may not be considered a major issue.
3. Increase alcohol retailers’ perception that violation of sales to minors laws will be detected and punished, creating a deterrent effect.
4. Decrease the likelihood that retailers will sell alcohol to minors, thereby reducing youth access to alcohol.
Numerous studies support the contribution of compliance checks to reducing underage access to alcohol. During the early to mid-1990s, before systematic compliance check programs were widely implemented, studies indicated that underage buyers were able to purchase alcohol without showing age ID in 47 percent to 97 percent of attempts (Preusser & Williams, 1992; Wagenaar & Wolfson, 1995). Observed rates of compliance have increased since then, and several studies suggest that the use of compliance checks does lead to reductions in sales to underage buyers. For example, Grube (1997) demonstrated that outlets subject to compliance checks were about half as likely to sell alcohol on a post-test purchase survey as outlets in the comparison sites. Similarly, in Concord, New Hampshire, sales to youth decreased from 28 percent to 10 percent after quarterly compliance checks (coupled with increased penalties and a media campaign) at 539 off-premises alcohol establishments (Centers for Disease Control and Prevention, 2004). And in a large study in Minnesota, sales to youth were reduced immediately by 17 percent in alcohol establishments that experienced a check (Wagenaar et al., 2005).

Additional analyses also found that establishments situated near another neighborhood establishment that had been checked within the last 90 days were less likely to sell alcohol to young-appearing buyers, but that these effects decay rapidly over time (Erickson et al., 2013).

Status of Compliance Check Protocols

Data for this policy were coded from formal compliance check protocols or guidelines. A total of 30 states and the District of Columbia have formal, written protocols; the remaining states either do not have these protocols or these protocols are not readily available to the public or were not available at the time of data collection. Compliance check protocols are generally issued by the state police or the state ABC agency. Guidelines vary somewhat in specificity and detail, possibly reflecting differences in the purposes of the checks and the evidentiary standards in each jurisdiction.

The maximum age of the decoy varies from 18–21 (only one state lists 21 as the maximum age), with the majority of jurisdictions requiring that the maximum age of the decoy be 20 (see Exhibit 1.20). The minimum age of the decoy ranges from 16–19, with 12 states requiring 18 as the minimum age of the decoy.

Twenty-four states have guidelines for the decoys’ appearance (e.g., appropriately dressed for age, and no hats, excessive makeup, or facial hair). These requirements vary widely by state. At least one state uses an age panel to ensure that the decoys appear underage. The majority (23) of the states prohibit decoys from verbally exaggerating their age. Decoy training is mandatory in 15 states. Sixteen states require decoys to have valid ID in their possession at the time of the check, whereas five states prohibit decoys from carrying ID with them during a compliance check.

---

15 It should be noted that data collection for this policy occurred during the beginning of the coronavirus pandemic. Not surprisingly, some states did not respond to a request for an update. When possible, the previous year’s entry for these states was confirmed as being current online. The change in number of states with written compliance check protocols from previous years (from 40 to 31) should not necessarily be interpreted as an indication that fewer states have these protocols.

Penalty Guidelines for Sales/Service to Minors

Policy Description
In the majority of states, ABC agencies are responsible for adjudicating administrative charges against licensees, including violations for sales or service to those under age 21. Alcohol law enforcement seeks to increase compliance with laws by increasing the level of perceived risk of detection and sanctions. Such deterrence involves three key components: (1) Perceived likelihood that a violation will lead to apprehension and sanction, (2) swiftness with which the sanction is imposed, (3) and severity of the sanction (Ross, 1992).

As stated in the 2004 NRC/IOM report, Reducing Underage Drinking: A Collective Responsibility, the effectiveness of alcohol control policies depends heavily on the “intensity of implementation and enforcement and on the degree to which the intended targets are aware of both the policy and its enforcement.” The report recommends that “enforcement agencies should issue citations for violations of underage sales laws, with substantial fines and temporary suspension of license for first offenses and increasingly stronger penalties thereafter, leading to permanent revocation of license after three offenses” (NRC & IOM, 2004). See above for a more comprehensive review of enforcement and deterrence research and strategies.

Although alcohol law enforcement agencies may issue the citations, adjudication of the cases is usually handled by another division or agency. States typically include administrative penalties in their statutory scheme prohibiting sales to minors. Penalty provisions are usually broad, allowing for severe penalties but delegating responsibility for determining actual penalties in particular cases to the ABC agencies or to other agencies responsible for adjudicating the cases. Penalties may include warning letters, fines, license suspensions, a combination of fines and suspensions, or license revocation. Agencies may consider both mitigating and aggravating circumstances as well as the number of violations within a given time period, with repeat offenders usually receiving more severe sanctions.

Many ABC agencies issue penalty guidelines to alert licensees to the sanctions that will be imposed for first, second, and subsequent offenses, providing a time period for determining repeat offenses. The agency may treat the guidelines as establishing a set penalty or range of penalties or may treat them as providing guidance, allowing for deviation at the agency’s discretion.

Penalty guidelines that establish firm, relatively severe penalties (particularly for repeat offenders) can increase the deterrent effect of the policy and its enforcement and can increase licensees’ awareness of the risks associated with violations.

Status of Penalty Guidelines for Sales/Service to Minors
At least 31 jurisdictions have defined administrative penalty guidelines for licensees that sell alcohol to an underage youth (see Exhibit 1.21). The remaining 20 states either do not have penalty guidelines or do not make them readily available to the public or were not available at
Guidelines vary widely across states. For example, although a few states may issue warning letters for first offenses if there are no aggravating circumstances, the majority of states impose fines or suspensions. Minimum fines for a first offense range from $50–$3,000, with more states in the $500–$1,000 range. Fines are typically in lieu of suspensions for first offenses, with some states allowing licensees to choose between the two sanctions. Three states (California, Florida, and New Mexico) have adopted the IOM recommendation that licenses should be revoked after three offenses, with an additional seven providing the option of revocation. Five states have guidelines that state that licenses are to be revoked for a fourth offense, with an additional two states and the District of Columbia providing the option of revocation.

As an example, Iowa can impose a $500 fine for a first offense, whereas a second offense within 2 years increases the penalty to a $1,500 fine and a 30-day suspension. Fines increase to as

16 It should be noted that data collection for this policy occurred during the beginning of the coronavirus pandemic. Not surprisingly, some states did not respond to a request for an update. When possible, the previous year’s entry for these states was confirmed as being current online.
much as $9,000 for a second offense in Utah to more than $30,000 for a fourth offense in the District of Columbia, with license suspension days increasing to as many as 180 days (for a second offense in Mississippi and for a third offense in Idaho). Time periods for defining repeat offenses range from 1–4 years.

States also vary in the specificity of their guidelines. Many states list a set penalty or a relatively limited range of penalties. For example, Florida lists a $1,000 fine and a 7-day suspension for a first offense, whereas Georgia’s guideline provides for penalties ranging from a $500–$2,500 fine and up to a 30-day suspension and a 12-month probation for first offenses. See Chapter 3 below for a review of penalties actually imposed by states for selling to and serving minors.

RBS Training

Policy Description
RBS training policies require or incentivize retail alcohol outlets to train licensees, managers, and servers/sellers to effectively implement policies and procedures that prevent alcohol sale and service to minors and intoxicated persons.

Server/seller training focuses on procedures for serving, selling, and checking age ID, along with techniques for recognizing signs of intoxication and intervening with intoxicated patrons. Manager training includes server/seller training, policy and procedures development, and staff supervision. RBS programs typically have distinct training curricula for on- and off-sale establishments because of the differing characteristics of these retail environments. All RBS programs focus on preventing sales and furnishing to minors.

RBS training can be mandatory or voluntary. A program is considered mandatory if state provisions require at least one specified category of individual (e.g., servers/sellers, managers, or licensees) to attend training. States may have either mandatory programs, voluntary programs, or both. For example, a state may make training for new licensees mandatory while also offering voluntary programs for existing licensees. Alternatively, a state may have a basic mandatory program while also offering a more intensive voluntary program that provides additional benefits for licensees choosing to participate in both.

States with voluntary programs usually provide incentives for retailers to participate in RBS training but do not impose penalties for those who decline involvement. Incentives vary by state and include: (1) A defense in dram shop liability lawsuits (cases filed by injured persons against retail establishments that provided alcohol to minors or intoxicated persons who later caused injuries to themselves or third parties); (2) discounts for dram shop liability insurance; (3) mitigation of fines or other administrative penalties for sales to minors or sales to intoxicated persons; and (4) protection against license revocation for sales to minors or intoxicated persons.

See the “Dram Shop Liability” policy for further discussion. The “Furnishing of Alcohol to Minors” policy discussion has additional information regarding prevention of alcohol sales to minors, and the “False ID” policy discussion includes materials related to age ID policies.

Status of RBS Training Policies
As of January 1, 2019, 39 states and the District of Columbia have some type of RBS training provision (see Exhibit 1.22). Of these, 13 states and the District of Columbia have mandatory provisions, 15 states have voluntary provisions, and 11 states have both. The 11 states that have both mandatory and voluntary provisions are California, Colorado, Illinois, Michigan, New Hampshire, North Carolina, Oregon, Pennsylvania, Rhode Island, Tennessee, and Washington.

Of the 25 jurisdictions with mandatory provisions, some apply their provisions to both on-sale (e.g., bars and restaurants) and off-sale (e.g., liquor stores) establishments, whereas some apply to either on-sale or off-sale establishments. Some of the mandatory jurisdictions apply their provisions to both new and existing establishments, whereas others apply them to either existing or new establishments.
Trends in RBS Policies

Between 2003–2019, the number of jurisdictions with mandatory policies increased from 15 to 25, and the number of states with voluntary policies rose from 17 to 26 (see Exhibit 1.23). The number of states with no RBS training policy decreased from 22 to 11.

Exhibit 1.22: RBS as of January 1, 2019
Data Sources and Citations

All data for the “Beverage Service Training and Related Practices” policy were obtained from the APIS website: https://alcoholpolicy.niaaa.nih.gov/apis-policy-topics/beverage-service-training-and-related-practices/26. APIS provides further descriptions of this policy and its variables, details regarding state policies, and a review of the limitations associated with the reported data.

Minimum Ages for Off-Premises Sellers

Policy Description

Most states have laws that specify a minimum age for employees who sell alcoholic beverages in off-premises establishments, such as liquor stores. In some states, the minimum age for sellers is 21. In many states, however, off-premises sellers may be younger than 21, and in a few states no minimum age is specified.

In some cases, persons under 21 may be allowed to sell alcohol only in certain types of off-premises establishments (e.g., grocery stores, convenience stores) or may be allowed to sell only some beverage types (e.g., beer, wine). In some cases, sellers of alcohol must be at least 18, but younger employees may be allowed to stock coolers with alcohol or to bag purchased alcohol.

Several states place conditions on off-premises sellers under 21 years old. These include requirements that a legal-age manager or supervisor be present when the underage person is selling alcoholic beverages.

State laws specifying the minimum age for employees who sell alcoholic beverages for on-premises consumption are described in the “Minimum Ages for On-Premises Servers and Bartenders” policy.

Status of Age of Seller Policies

Minimum Age of Sellers and Types of Beverages

Most jurisdictions specify the same minimum age for sellers of all types of alcoholic beverages. As of January 1, 2019, eight states specify that off-premises sellers be 21 or older for all beverage types. Two states (Idaho and Indiana) require off-premises sellers to be at least 19 years old for all beverage types. Twenty-six states and the District of Columbia have set the minimum age at 18 for at least one beverage. Nine states set the minimum age between 15–17. Ten states do not specify any minimum age for sellers for of at least one beverage type. For an example of how these policies impact a specific beverage, please see Exhibit 1.24, showing the minimum allowed age to sell beer by state.

Among states with requirements, the minimum age varies by type of alcohol, with age requirements generally higher for the sale of distilled spirits and lower for beer.

Manager or Supervisor Presence

Fourteen states require that a supervisor or manager be present when an underage seller conducts an alcoholic beverage transaction.

Trends in Age of Seller Policies

There were no changes in age of seller policies across states between 2003–15. As of June 1, 2016, Connecticut added a “manager or supervisor presence” to their Age of Seller, Off-Premises requirement; Nebraska reduced the minimum age of seller age for beer, wine, and distilled spirits from 19 to 16. As of October 1, 2019, Oklahoma reduced the minimum age to sell beer and wine to 18 years of age. As of January 1, 2019, Colorado reduced the minimum age to sell beer from 21 to 18 years of age (see Exhibit 1.25).

Data Sources and Citations

All data for the “Minimum Ages for Off-Premises Sellers” policy were obtained from the APIS website: https://alcoholpolicy.niaaa.nih.gov/apis-policy-topics/minimum-ages-for-off-premises-sellers/37. APIS provides further descriptions of this policy and its variables, details regarding state policies, and a review of the limitations associated with the reported data.

Minimum Ages for On-Premises Servers and Bartenders

Policy Description

All states specify a minimum age for employees who serve or dispense alcoholic beverages. Generally, the term “servers” refers to waitpersons, and “bartenders” refers to individuals who dispense alcoholic beverages. These restrictions recognize that underage employees, particularly those who are unsupervised, may lack the maturity and experience to conduct adequate checks of age ID and to resist pressure from underage peers to complete illegal sales.

States vary widely in terms of minimum age requirements for servers and bartenders. In some states, the minimum age for both types of employee is 21, but others set lower minimum ages, particularly for servers. No state permits underage bartenders while prohibiting underage servers. Some states permit servers or bartenders younger than 21 to work only in certain types of on-premises establishments, such as restaurants, or to serve only certain beverage types, such as beer or wine. Underage servers and bartenders may be allowed only if legal-age managers or supervisors are present when underage persons are serving alcoholic beverages or tending bar. State laws setting a minimum age for employees who sell alcohol at off-premises establishments are described in the “Minimum Ages for Off-Premises Sellers” policy.

Status of Age of Server Policies

Age of Servers

As of January 1, 2019, Alaska, Nevada, and Utah specify that on-premises alcohol servers of beer, wine, or distilled spirits must be 21 or older. Only one state (Maine) allows 17-year-olds to be servers. Eight states specify that servers be at least 19 or 20, and the remaining 38 states and the District of Columbia allow 18-year-old servers. For an example of how these policies impact a specific beverage, please see Exhibit 1.26, showing the minimum allowed age to serve beer by state.

Age of Bartenders

Minimum ages for bartenders are generally higher than for servers across the states. Nineteen states and the District of Columbia limit bartending to persons 21 or older. Twenty-six states allow 18-year-olds to bartend for at least some beverage types, whereas only one state (Maine) allows 17-year-olds to bartend. Four states set the minimum age for bartenders at either 19 or 20 years old.

Manager or Supervisor Presence

Nine states require that a supervisor or manager be present when an underage seller conducts an alcoholic beverage transaction.

Trends in Age of Server Policies

State policies for ages of servers and bartenders in on-premises establishments have been generally stable over the last decade. Exhibit 1.27 shows the distribution over time of minimum age allowances for serving beer. Between 2003–19, Arkansas lowered its minimum age for servers from 21 to 19, and North Dakota, Arizona, and Delaware lowered their age for servers from 19 to 18.
Exhibit 1.26: Minimum Ages for On-Premises Servers (Beer) as of January 1, 2019

Exhibit 1.27: Distribution of Minimum Ages for On-Premises Servers of Beer, January 1, 2003–January 1, 2019

APIS provides further descriptions of this policy and its variables, details regarding state policies, and a review of the limitations associated with the reported data.

Distance Limitations Applied to New Alcohol Outlets Near Universities, Colleges, and Primary and Secondary Schools

Policy Description
Policies that limit the placement of retail alcohol outlets near colleges and schools are designed to make alcohol less accessible to youth by keeping alcohol sales physically distant from locations where underage people congregate. In addition, such policies aim to reduce the social availability of alcohol by limiting youth exposure to alcohol consumption.

Outlets Near Colleges and Universities
Alcohol outlet density in general is linked to excessive alcohol consumption and related harms according to research collected and evaluated by the Community Preventive Services Task Force and presented in the Community Guide (Campbell et al., 2009; Task Force on Community Preventive Services, 2009). The Community Guide recommends the use of regulatory authority—for example through zoning and licensing—to reduce alcohol outlet density.

Limiting the location of retail outlets near colleges and universities and their high concentrations of underage people who drink is one way to implement this recommendation in a high-risk setting. The NIAAA publication, A Call to Action: Changing the Culture of Drinking at U.S. Colleges, includes limiting alcohol outlet density as an evidence-based, recommended strategy for reducing college drinking (NIAAA, 2002).

Research shows a correlation between underage drinking and retail outlet density near college and university campuses. In a study of eight universities, outlet density was correlated with heavy and frequent drinking among college students, including underage students (Weitzman et al., 2003). Another study found that both on- and off-premises alcohol outlet densities were associated with campus rape offense rates; the effect of on-campus densities was reduced when student drinking levels were considered (Scribner et al., 2010).

A third study examined “secondhand” effects of drinking on residential neighborhoods near college campuses and concluded that limiting the number of outlets near colleges, particularly those colleges with high rates of binge drinking, could mitigate the secondhand effects (Wechsler et al., 2002). A 1996 study found higher rates of drinking and binge drinking among college students when there were higher numbers of alcohol outlets within 1 mile of campus (Chaloupka & Wechsler, 1996).

Outlets Near Primary and Secondary Schools
Limiting outlets near primary and secondary schools is another way to reduce alcohol outlet density in a high-risk setting of underage drinking, although there is no nationwide research comparable to that for universities that focuses specifically on the relationship between drinking by K–12 students and the proximity of alcohol outlets to their schools. However, a 2016 study of more than 25,000 Maryland high school students found a positive relationship between the number of alcohol outlets near a school and the perceived availability of alcohol, tobacco, and drugs among girls (Milam et al., 2016). Perceived availability was associated with self-reported substance use.
**Types of Outlet Density Restrictions**

Outlet density restrictions typically require that alcohol outlets be located a certain distance from a school. Such restrictions may regulate the location of retail outlets near colleges and universities, near primary and secondary schools, or near both categories of schools. Some restrictions limit the sale of alcohol directly on university campuses. Outlet density restrictions may apply to off- and on-premises retailers, or both types of retailers. Restrictions may also apply to the sale of beer, wine, spirits, or some combination of the three.

Distance requirements vary widely, from 100 feet (the distance a primary or secondary school in Illinois must be from an off-premises outlet) to 1.5 miles (the distance a university in California must be from an outlet selling wine or spirits). Restrictions that mandate greater distances are more likely to promote the goals of keeping alcohol away from underage individuals and reducing their exposure to alcohol marketing.

Distance restrictions apply to the issuance of new licenses, and retail alcohol outlets that were in business prior to the enactment of the restriction may still be allowed to operate within the restricted zone. In these cases, the distance restriction would prevent increased alcohol outlet density without necessarily reducing density or eliminating the presence of retail establishments in the restricted zone.

**Status of Outlet Density Restrictions**

**Colleges and Universities**

Twelve states and the District of Columbia have some type of restriction on outlet density near colleges and universities, whereas 38 states have no restrictions. Of the 13 jurisdictions with restrictions, 11 have restrictions that apply to both on- and off-premises outlets. Kansas’ restriction applies only to off-premises outlets, and Nebraska's restriction applies only to on-premises outlets.

Nearly all of the restrictions apply to beer, wine, and spirits. California’s and Mississippi’s restrictions apply only to wine and spirits, North Carolina’s restriction applies to beer and wine, and West Virginia’s applies only to beer. Exhibit 1.28 identifies those states with restrictions on colleges and universities and whether these restrictions apply to off- or on-premise outlets.

**Primary and Secondary Schools**

Many more states have laws restricting outlet location near primary and secondary schools. Thirty states and the District of Columbia have some restriction, whereas 20 states have none. Of the 31 jurisdictions restricting outlet location near schools, 23 apply restrictions to both off- and on-premises locations. Restrictions apply only to on-premises locations in six states: Florida, Hawaii, Idaho, Maine, Montana, and Rhode Island. Arkansas and Kansas restrict only off-premises locations.

Most of the restrictions apply to beer, wine, and spirits. Restrictions in Arkansas, Mississippi, New York, and Wisconsin apply to wine and spirits; North Carolina’s restrictions apply to beer and wine, whereas West Virginia’s restriction applies only to beer. Exhibit 1.29 displays the states with restrictions on primary and secondary schools and identifies whether the restrictions apply to off- or on-premise outlets.

**Dram Shop Liability**

**Policy Description**

Dram shop liability refers to the civil liability that commercial alcohol providers face for injuries or damages caused by their intoxicated or underage drinking patrons. The analysis of this policy topic in this document is limited to alcohol service to minors. The most common factual scenario in legal cases arising from dram shop liability is a licensed retail alcohol outlet furnishing alcohol to a minor who, in turn, causes an alcohol-related motor vehicle crash that injures a third party.

In states with dram shop liability, the injured third party (“plaintiff”) may be able to sue the retailer (as well as the minor who caused the crash) for monetary damages. Liability is relevant only if an injured private citizen files a lawsuit. The state’s role is to provide a forum for such a lawsuit; the state does not impose a dram shop–related penalty directly. (This distinguishes dram shop liability from the underage furnishing policy, which results in criminal liability imposed by the state.)

Dram shop liability is closely related to the policy on furnishing alcohol to minors, but the two topics are distinct. Retailers who furnish alcohol to minors may face fines or other punishment imposed by the state as well as dram shop liability lawsuits filed by parties injured as a result of the same incident. Dram shop liability and social host liability (presented elsewhere in this report) are identical, except that the former involves lawsuits filed against commercial alcohol retailers and the latter involves lawsuits filed against non-commercial alcohol providers.

Dram shop liability serves two purposes: (1) It creates a disincentive for retailers to furnish to minors because of the risk of litigation leading to substantial monetary losses, and (2) it enables parties injured as a result of an illegal sale to a minor to gain compensation from those responsible for the injury. The minor causing the injury is the primary and most likely party to be sued. Typically, the retailer is sued through a dram shop claim when the minor does not have the resources to fully compensate the injured party.

Dram shop liability is established by statute or by a state court through “common law.” Common law is the authority of state courts to establish rules by which an injured party can seek redress against the person or entity that negligently or intentionally caused injury. Courts can establish these rules only when the state legislature has not enacted its own statutes, in which case the courts must follow the legislative dictates (unless found to be unconstitutional). Thus, dram shop statutes normally take precedence over dram shop common law court decisions. This analysis includes both statutory and common law dram shop liability for each state.

A common law liability designation signifies that the state allows lawsuits by injured third parties against alcohol retailers for the negligent service or provision of alcohol to a minor. Common law liability assumes the following procedural and substantive rules:

1. A negligence standard applies (i.e., the defendant did not act as a reasonable person would be expected to act in like circumstances). Plaintiffs need not show that the defendant acted intentionally, willfully, or with actual knowledge of the minor’s underage status.

---

17 Dram shops were retail establishments that sold distilled spirits by the “dram,” a liquid measure that equals 1 ounce. This form of liability is also known as “commercial host liability.”
2. Damages are not arbitrarily limited. If negligence is established, the plaintiff receives actual damages and can seek punitive damages.

3. Plaintiffs can pursue claims against defendants without regard to the age of the person who furnished the alcohol and the age of the underage person furnished with the alcohol.

4. Plaintiffs must establish only that minors were furnished alcohol and that the furnishing contributed to the injury without regard to the minor’s intoxicated state at the time of sale.

5. Plaintiffs must establish key elements of the lawsuit via “preponderance of the evidence” rather than a more rigorous standard (e.g., “beyond a reasonable doubt”).

A statutory liability designation indicates that the state has a dram shop statute. Statutory provisions can alter the common law rules listed above, restricting an injured party’s ability to make successful claims. This analysis includes three of the most important statutory limitations:

1. Limitations on damages: Statutes may impose statutory caps on the total dollar amount that plaintiffs may recover through dram shop lawsuits.

2. Limitations on who may be sued: Potential defendants may be limited to only certain types of retail establishments (e.g., on-premises but not off-premises licensees) or certain types of servers (e.g., servers above a certain age).

3. Limitations on elements or standards of proof: Statutes may require plaintiffs to prove additional facts or meet a more rigorous standard of proof than would normally apply in common law. Statutory provisions may require a plaintiff to:
   a. Establish that the retailer knew the minor was underage or that the retailer intentionally or willfully served the minor.
   b. Establish that the minor was intoxicated at the time of sale or service.
   c. Provide clear and convincing evidence or evidence beyond a reasonable doubt that the allegations are true.

These limitations can restrict circumstances that can give rise to liability or greatly diminish a plaintiff’s chances of prevailing in a dram shop liability lawsuit, thus reducing the likelihood of a lawsuit being filed. Other restrictions may also apply. For example, many states do not allow “first-party claims,” cases brought by the person who was furnished alcohol for his or her own injuries. These additional limitations are not discussed here.

Some states have enacted RBS affirmative defenses. In these states, a defendant may avoid liability if it can establish that its retail establishment had implemented an RBS program and was adhering to RBS practices at the time of the service to a minor. Texas has enacted a more sweeping RBS defense. There, a defendant licensee can avoid liability if it establishes that: (1) It did not encourage the illegal sale, and (2) it required its staff, including the server in question, to attend RBS training. Proof that RBS practices were being adhered to at the time of service is not required.

See the “RBS Training” policy topic for more information.
Exhibit 1.30: Common Law/Statutory Dram Shop Liability and Limitations as of January 1, 2019

Status of Dram Shop Liability

As of January 1, 2019, 45 jurisdictions imposed dram shop liability as a result of statutory or common law or both (see Exhibit 1.30). The District of Columbia and 28 states have either common law liability or statutory liability or both with no identified limitation. The remaining 16 states impose one or more limits on statutory dram shop liability, including limits on the damages that may be recovered, limits on who may be sued, and stricter standards for proof of wrongdoing than for usual negligence. Eight states provide an RBS defense for alcohol outlets (see Exhibit 1.31). Seven states provide an affirmative RBS defense, and one state provides a complete RBS defense.

Trends in Dram Shop Liability for Furnishing Alcohol to a Minor

Between 2009–19, the number of jurisdictions that permit dram shop liability have remained constant.

Social Host Liability

Policy Description

Social host liability refers to the civil liability that non-commercial alcohol providers face for injuries or damages caused by their intoxicated or underage drinking guests. The analysis in this policy topic does not address social host liability for serving adult guests.

The most common factual scenario in legal cases arising from social host liability involves an underage drinking party at which the party host furnishes alcohol to a minor who, in turn, injures a third party in an alcohol-related incident (often a motor vehicle crash). In states with social host liability, injured third parties (“plaintiffs”) may be able to sue social hosts (as well as the minor who caused the crash) for monetary damages. Liability is triggered only if injured private citizens file lawsuits. The state’s role is to provide a forum for such lawsuits; the state does not impose social host–related penalties directly. (As discussed below, this distinguishes social host liability from underage furnishing and host party policies, which can result in criminal liability imposed by the state and are discussed under “Furnishing Alcohol to Minors” above and “Hosting Underage Drinking Parties” below.)

Social host liability is closely related to the underage furnishing and host party policies, but the three are distinct. Underage furnishing policies and host party policies allow the state to impose fines or other punishment upon social hosts who furnish alcohol to minors or allow underage drinking parties on their property. In contrast, social host liability policies allow injured parties to file lawsuits against social hosts for damages stemming from the same conduct. Social host liability and dram shop liability (presented elsewhere in this report) are identical policies except that the former involves lawsuits brought against non-commercial alcohol retailers, and the latter involves lawsuits filed against commercial alcohol providers.

Social host liability serves two purposes: (1) It creates disincentives for social hosts to furnish to minors due to the risk of litigation and possible substantial monetary losses, and (2) it allows those injured as a result of illegal furnishing of alcohol to minors to gain compensation from the person(s) responsible for their injuries. Minors causing injuries are the primary and most likely parties to be sued. Typically, social hosts are sued through social host liability claims when minors do not have the resources to fully compensate the injured parties.

Social host liability is established by statute or by a state court through “common law.” Common law refers to the authority of state courts to establish rules by which injured parties can seek redress against persons or entities that negligently or intentionally caused injuries. Courts have the authority to establish these rules only when state legislatures have not enacted their own statutes, in which case the courts must follow legislative dictates (unless found to be unconstitutional). Thus, social host statutes normally take precedence over social host common law court decisions.

Many states require evidence that social hosts furnished alcohol to the underage guest, although others permit liability if social hosts allowed underage guests to drink on the hosts’ property, even if the hosts did not furnish the alcohol. This analysis does not report the states that have adopted this more permissive standard. The analysis includes both statutory and common law social host liability for each state.
A common law liability designation signifies that the state allows lawsuits by injured third parties against social hosts for the negligent service or provision of alcohol to minors in non-commercial settings. Common law liability assumes the following procedural and substantive rules:

1. A negligence standard applies (i.e., defendants did not act as reasonable persons would be expected to act in similar circumstances). Plaintiffs need not show that defendants acted intentionally, willfully, or with actual knowledge of minors’ underage status.
2. Damages are not arbitrarily limited. If successful in establishing negligence, plaintiffs receive actual damages and have the possibility of seeking punitive damages.
3. Plaintiffs can pursue claims against defendants without regard to the age of the person who furnished the alcohol and the age of the underage person furnished with the alcohol.
4. Plaintiffs must establish only that minors were furnished with alcohol and that the furnishing contributed to injuries without regard to the minors’ intoxicated state at the time of the party.
5. Plaintiffs must establish the key elements of lawsuits by “preponderance of the evidence” rather than a more rigorous standard (such as “beyond a reasonable doubt”).

A statutory liability designation indicates that a state has a social host liability statute. Statutory provisions can alter the common law rules listed above, restricting an injured party’s ability to make successful claims. This analysis includes three of the most important statutory limitations:

1. Limitations on damages: Statutes may impose statutory caps on the total dollar amount that plaintiffs may recover through social host lawsuits.
2. Limitations on who may be sued: Potential defendants may be limited to persons above a certain age.
3. Limitations on elements or standards of proof: Statutes may require plaintiffs to prove additional facts or meet a more rigorous standard of proof than would normally apply in common law. The statutory provisions may require the plaintiff to:
   a. Establish that hosts had knowledge that minors were underage or prove that social hosts intentionally or willfully served minors.
   b. Establish that the minors were intoxicated at the time of service.
   c. Provide clear and convincing evidence or evidence beyond a reasonable doubt that the allegations are true.

These limitations can limit the circumstances that can give rise to liability or greatly diminish plaintiffs’ chances of prevailing in a social host liability lawsuit, thus reducing the likelihood of a lawsuit being filed. Additional restrictions may also apply. For example, many states do not allow “first-party claims,” cases brought by the person who was furnished alcohol for his or her own injuries. These additional limitations are not tracked here.

**Status of Social Host Liability**

As of January 1, 2019, 34 states impose social host liability through statutory or common law; 14 states and the District of Columbia do not impose social host liability (see Exhibit 1.32). In New Jersey and Rhode Island, there is no statutory liability, and common law liability is unclear. Nineteen states have either common law liability or statutory social host liability with no identified limitations. The remaining states with social host liability impose one or more limits on statutory liability, including limits on the damages that may be recovered, limits on who may be sued, and standards of proof of wrongdoing that are stricter than usual negligence standards.
Exhibit 1.32: Common Law/Statutory Social Host Liability as of January 1, 2019

Trends in Social Host Liability for Furnishing Alcohol to a Minor

In the years between 2009–19, the number of states that permit social host liability increased by two (California and Maryland).

Hosting Underage Drinking Parties

Policy Description

Host party laws establish state-imposed liability against individuals (social hosts) responsible for underage drinking events on property they own, lease, or otherwise control. The primary purpose of these laws is to deter underage drinking parties by raising the legal risk for individuals who allow underage drinking events on property they own, lease, or otherwise control.

Underage drinking parties pose significant public health risks. They are high-risk settings for binge drinking and associated alcohol problems, including impaired driving. Young people who drink are often introduced to heavy drinking behaviors at these events. Law enforcement officials report that, in many cases, underage drinking parties occur on private property, but the adult responsible for the property is not present or cannot be shown to have furnished the alcohol. Host party laws address this issue by providing a legal basis for holding persons responsible for parties on their property whether or not they provided alcohol to minors.

Host party laws often are closely linked to laws prohibiting the furnishing of alcohol to minors (analyzed elsewhere in this report), although laws that prohibit hosting underage drinking parties may apply without regard to who furnishes the alcohol. Hosts who allow underage drinking on their property and also supply the alcohol consumed or possessed by the minors may be in violation of two distinct laws: (1) Furnishing alcohol to a minor and (2) allowing underage drinking to occur on property they control.

Two general types of liability may apply to those who host underage drinking parties. The first, analyzed here, concerns state-imposed liability. State-imposed liability involves a statutory prohibition that is enforced by the state, generally through criminal proceedings that can lead to sanctions such as fines or imprisonment. The second, social host liability (analyzed elsewhere in this report), involves an action by a private party seeking monetary damages for injuries that result from permitting underage drinking on the host’s premises.

Although related, these two forms of liability are distinct. For example, an individual may allow a minor to drink alcohol, after which the minor causes a motor vehicle crash that injures an innocent third party. In this situation, the social host may be prosecuted by the state under a criminal statute and face a fine or imprisonment for the criminal violation. In a state that provides for social host civil liability, the injured third party could also sue the host for monetary damages associated with the motor vehicle crash.

State host party laws differ across multiple dimensions, including the following:
1. They may limit their application specifically to underage drinking parties (e.g., by requiring a certain number of minors to be present for the law to take effect) or may prohibit hosts from allowing underage drinking on their property generally, without reference to hosting a party.
2. Underage drinking on any of the host’s properties may be included, or the laws may restrict their application to residences, out-buildings, or outdoor areas.
3. The laws may apply only when hosts make overt acts to encourage the party, or they may require only that hosts knew about the party or were negligent in not realizing that parties were occurring (i.e., should have known based on the facts available).
4. A defense may be available for hosts who take specific preventive steps to end parties (e.g., contacting police) once they become aware that parties are occurring.
5. The laws may require differing types of behavior on the part of the minors at the party (possession, consumption, intent to possess or consume) before a violation occurs.
6. Jurisdictions have varying exceptions in their statutes for family members or others, or for other uses or settings involving the handling of alcoholic beverages.

**Status of Host Party Laws**

As of January 1, 2019, 21 jurisdictions have general host party laws, ten have specific host party laws, and 20 have no laws of either sort (see Exhibit 1.33). Of the jurisdictions with host party laws, most apply to both residential and outdoor property, and only four apply to residential property but not outdoor property. Of the 31 jurisdictions with host party laws, 23 require that the host knew about the party to trigger liability; in the remaining states, the standard varies. Finally, the majority of jurisdictions with host party laws have family exceptions.

**Trends in Host Party Law Policies**

Between 1998–2019, the number of jurisdictions that enacted specific host party laws rose from five to ten, and the number that enacted general host party laws rose from 11 to 21. In 1998, there were 16 host party laws of both types; in 2019 there are 31 (see Exhibit 1.34).
Exhibit 1.34: Number of States With Prohibitions Against Hosting Underage Drinking Parties, January 1, 1998–January 1, 2019

Data Sources and Citations

All data for the “Prohibitions against Hosting Underage Drinking Parties” policy were obtained from the APIS website: https://alcoholpolicy.niaaa.nih.gov/apis-policy-topics/prohibitions-against-hosting-underage-drinking-parties/41. APIS provides further descriptions of this policy and its variables, details regarding state policies, and a review of the limitations associated with the reported data.

Retailer Interstate Shipments of Alcohol

Policy Description

This policy addresses state laws that prohibit or permit retailers to ship alcohol directly to consumers located across state lines, usually by ordering alcohol over the Internet. It is related to, but distinct from, both the direct shipment policy, which addresses alcohol shipments to consumers by alcohol producers, and the home delivery policy, which involves retailer deliveries to consumers within the same state.

Retailer interstate shipments may be an important source of alcohol for underage people who drink. In a North Carolina study (Williams & Ribisl, 2012), a group of eight 18- to 20-year-old research assistants placed 100 orders for alcoholic beverages using Internet sites hosted by out-of-state retailers. Forty-five percent of the orders were successfully completed, whereas 39 percent were rejected as a result of age verification. The remaining 16 percent of orders failed for reasons believed to be unrelated to age verification (e.g., technical and communication problems with vendors). Most vendors (59 percent) used weak, if any, age verification at the point of order, and, of the 45 successful orders, 23 (51 percent) had no age verification at all. Age verification at delivery was also inconsistently applied.

The North Carolina study reported that there are more than 5,000 Internet alcohol retailers, and that the retailers make conflicting claims regarding the legality of shipping alcohol across state lines to consumers. There were also conflicting claims regarding the role of common carriers. The North Carolina study reported that all deliveries were made by such companies, and many Internet alcohol retailers list well-known common carriers on their websites. Yet carriers contacted by the study researchers stated they do not deliver packages of alcohol except with direct shipping permits. This suggests confusion regarding state laws addressing interstate retail shipments. North Carolina prohibits such shipments, which means that at least 43 percent of the retailers in the study appeared to have violated the state law.

The NRC/IOM report on reducing underage drinking recognized the potential for young people to obtain alcohol over the Internet. It recommended that states either ban such sales or require alcohol labeling on packages and signature verification at the point of delivery (NRC & IOM, 2004).

Several potential barriers to implementing and enforcing bans on retailer interstate alcohol sales include:

1. States will have difficulty securing jurisdiction over out-of-state alcohol retailers.
2. States may have little incentive to use limited enforcement resources to address in-state alcohol retailers that are shipping out of state because they are not violating state law, taxes are being collected, and any problems occur out of state.
3. Enforcing bans on retailer interstate shipments may prompt online retailers to locate outside the country (many already are foreign based), creating additional jurisdictional and enforcement problems.

Types of Restrictions on Interstate Internet Sales

The restrictions addressed in this policy vary by beverage type (beer, wine, distilled spirits). Interstate shipments may be prohibited for one beverage type, more than one beverage type,
or all three beverage types. Some states place restrictions on interstate Internet sales, including requiring a direct shipping permit and limiting the amount of beverage that may be shipped.

**Current Status of Interstate Internet Sales**

Thirty-two states (see Exhibit 1.35) prohibit retail interstate sales of all three beverage types, seven prohibit sales of two beverage types, and two prohibit sales of one beverage type. Spirits are the most commonly prohibited beverage (41 states), followed by beer (38 states) and wine (33 states). Two jurisdictions (District of Columbia and Kentucky) expressly permit interstate sales of all three beverage types. In eight states, retailer interstate sales laws were deemed uncodable for at least one beverage type (beer, wine, liquor). For purposes of this summary, these states are treated as *not* expressly prohibiting interstate Internet sales for the uncodable beverage types.

**Exhibit 1.35: Number of Beverage Types for Which Interstate Internet Sales Are Expressly Prohibited as of January 1, 2019**

Direct Sales/Shipments from Producers to Consumers

Policy Description

State proscriptions against direct sales and shipments of alcohol from producers to consumers date back to the repeal of Prohibition. The initial reason for the proscriptions was to ensure that the pre-Prohibition-era “tied house system” (under which producers owned or controlled retail outlets directly or both) did not continue after repeal. Opponents of the tied house system argued that producers who controlled retail outlets permitted unsafe retail practices and failed to respond to community concerns. The alternative that emerged was a three-tier production and distribution system with separate production, wholesaling, and retail elements. Thus, producers must distribute products through wholesalers rather than sell directly to retailers or consumers, wholesalers must purchase from producers, and consumers must purchase from retailers.

Modern marketing practices, particularly Internet sales that link producers directly to consumers, have led many states to create laws with exceptions to general mandates that alcohol producers distribute their products only through wholesalers. Some states permit producers to ship alcohol to consumers using a delivery service (usually a common carrier). In some cases, these exceptions are responses to legal challenges by producers or retailers arguing that state law unfairly discriminates between in-state and out-of-state producers. The U.S. Supreme Court has held that state laws permitting in-state producers to ship directly to consumers while barring out-of-state producers from doing so violate the U.S. Constitution’s Interstate Commerce Clause, and that this discrimination is neither authorized nor permitted by the 21st Amendment.  

One central concern emerging from this controversy is the possibility that direct sales/shipments (either through Internet sales or sales made by telephone or other remote communication) will increase alcohol availability to underage persons.

Young people may attempt to purchase alcohol through direct sales instead of face-to-face sales at retail outlets because they perceive that detection of their underage status is less likely. These concerns were validated by a study that found that Internet alcohol vendors use weak, if any, age verification, thereby allowing minors to successfully purchase alcohol online (Williams & Ribisl, 2012). In response to these concerns, several jurisdictions that permit direct sales/shipments have included provisions to deter youth access. These may include requirements that:

1. Consumers have face-to-face transactions at producers’ places of business (and show valid age ID) before any future shipments to consumers can be made.
2. Producers/shippers and deliverers verify recipient age, usually by checking recipients’ ID.
3. Producers/shippers and deliverers obtain permits or licenses or be approved by the state.
4. Producers/shippers and deliverers maintain records that must either be reported to state officials or be open for inspection to verify recipients of shipments.
5. Direct shipment package labels include statements that the package contains alcohol and that the recipient must be at least 21 years old.

---

19 Laws that require face-to-face transactions for all sales prior to delivery are treated as prohibitions on direct sales/shipments.
State laws also vary on the types of alcoholic beverages (beer, wine, distilled spirits) that producers may sell directly and ship to consumers. These and other restrictions may apply to all direct shipments. Only those requirements related to preventing underage sales are discussed here.\(^{20}\)

**Status of Direct Sales/Shipment Policies**

As of January 1, 2019, 45 jurisdictions permit direct sales/shipments from producers to consumers, and six prohibit such transactions (see Exhibit 1.36). Of the 45 jurisdictions permitting direct sales or shipments, 30 require some form of age verification, whether by shippers, deliverers, or both. Fourteen states and the District of Columbia do not require any age verification. One state (Arkansas) requires face-to-face transactions at producers’ places of business and verification of valid age ID before shipments to the consumer can be made.

---

This includes caps on the amount that can be shipped; laws that permit only small producers to sell directly to consumers; reporting and taxation provisions unrelated to identifying potential underage recipients; and brand registration requirements. In some cases, exceptions are so limited that a state is coded as not permitting direct sales (e.g., shipments are allowed only by boutique historical distilled spirits producers).

---

\(^{20}\) These include caps on the amount that can be shipped; laws that permit only small producers to sell directly to consumers; reporting and taxation provisions unrelated to identifying potential underage recipients; and brand registration requirements. In some cases, exceptions are so limited that a state is coded as not permitting direct sales (e.g., shipments are allowed only by boutique historical distilled spirits producers).
Trends in Direct Sales/Shipments Policies

Between January 1, 2009–January 1, 2019, 15 states amended their existing direct shipping policies. Twelve of these states added restrictions on direct shipment, such as requiring labels, collecting purchaser names, or adding age verification requirements, and three states removed restrictions. During the same time period, nine other states (Arkansas, Kansas, Maine, Maryland, New Jersey, Oklahoma, Pennsylvania, South Dakota, and Tennessee) adopted permit systems allowing direct shipment of wine from producers to purchasers.

Keg Registration

Policy Description
Keg registration laws (also called keg tagging laws) require wholesalers or retailers to attach tags, stickers, or engravings with an ID number to kegs exceeding a specified capacity. These laws discourage purchasers from serving underage persons from the keg by allowing law enforcement officers to trace the keg to the purchaser even if he or she is not present at the location where the keg is consumed.

At purchase, retailers are required to record identifying information about the purchaser (e.g., name, address, telephone number, driver’s license). In some states, keg laws specifically prohibit destroying or altering the ID tags and provide penalties for doing so. Other states make it a crime to possess unregistered or unlabeled kegs.

Refundable deposits may also be collected for the kegs themselves, the tapper mechanisms used to serve the beer, or both. Deposits are refunded when the kegs and tappers are returned with ID numbers intact. These deposits create an incentive for the purchaser to keep track of the whereabouts of the keg, because a financial penalty is imposed if the keg is not returned.

Some jurisdictions collect information (e.g., location where the keg contents are to be consumed, tag number of the vehicle transporting the keg) to aid law enforcement efforts, further raising the chances that illegal furnishing to minors will be detected. Some jurisdictions also require retailers to provide warning information at the time of purchase about laws prohibiting service to minors and other laws related to the purchase or possession of the keg.

Disposable kegs complicate keg registration laws. Some of these containers meet the capacity definition for a keg but cannot be easily tagged or traced, as they are meant to be disposed of when empty. Most states do not differentiate disposable from non-disposable kegs, although some have modified keg registration provisions to accommodate this container type.

Status of Keg Registration Policies

Keg Registration Laws
As of January 1, 2019, the District of Columbia and 29 states require keg registration, and 20 states do not require keg registration. Minimum keg sizes subject to keg registration requirements range from 2 gallons to 7.75 gallons with the exception of South Dakota, where the requirements are 8 gallons or 16 gallons. Utah alone prohibits keg sales altogether, making a keg registration law irrelevant.

Prohibited Acts
Separately from requiring retailers to register kegs, some states prohibit anyone from possessing unregistered kegs, or destroying keg labels, or both. Twenty-six states and the District of Columbia prohibit neither act.

Purchaser Information Collected
All 30 jurisdictions with keg registration laws require retailers to collect some form of purchaser information, such as purchaser’s name and address, a driver’s license, or other government-
issued ID. Six jurisdictions also require purchasers to provide the address where the keg will be consumed.

**Warning Information to Purchasers**

Of the 30 jurisdictions with keg registration laws, 22 states and the District of Columbia require that some kind of warning information be presented to purchasers about the violation of any laws related to keg registration (see Exhibit 1.37). Warnings are either “active” (requiring an action on the part of the purchaser, such as signing a document), or “passive” (requiring no action on the part of the purchaser). Seven states do not require that any warning information be given to purchasers.

**Trends in Keg Registration Policies**

The number of states enacting keg registration laws rose steadily between 2003–08, with an increase from 20 to 30 jurisdictions. As of January 1, 2019, 30 jurisdictions have keg laws. Michigan eliminated its keg registration law in 2018 (see Exhibit 1.38).
Data Sources and Citations

All data for the “Keg Registration” policy were obtained from the APIS website: https://alcoholpolicy.niaaa.nih.gov/apis-policy-topics/keg-registration. APIS provides further descriptions of this policy and its variables, details regarding state policies, and a review of the limitations associated with the reported data.

Home Delivery

Policy Description
Home delivery restrictions prohibit or limit the ability of alcohol retailers to deliver alcoholic beverages to customers who are not present at their retail outlet. Delivery of alcohol may increase alcohol availability to youth by increasing opportunities for underage persons to subvert minimum age purchase requirements (Wagenaar, et al., 2005). Ordering by phone, fax, or email may facilitate deception. Delivery persons may have less incentive to check purchasers’ age ID when they are away from the licensed establishment and cannot be watched by a surveillance camera, the liquor store’s management, or other customers.

Research on home delivery of alcohol is limited. A study of the use of home delivery by adult men found that people who drink regularly without a history of alcohol problems were significantly less likely to have had alcohol delivered than people with problem drinking (Fletcher, et al., 1996). Another study found similar results for underage individuals who drink. Ten percent of 12th graders and 7 percent of 18- to 20-year-olds in 15 Midwestern communities reported they obtained alcohol through delivery services in the last year. Use of delivery services was more prevalent among young men and among people engaging in more frequent, heavier drinking (Fletcher, et al., 2000).

A state home delivery law may:
1. Specifically prohibit or permit the delivery of beer, wine, or spirits to residential addresses, hotel rooms, conference centers, and so on.
2. Permit home delivery but with restrictions, including:
   a. Limits on the quantity that may be delivered.
   b. Limits on the time of day or days of the week when deliveries may occur.
   c. A requirement that the retail merchant obtain a special license or permit.

In some states that allow home delivery, local ordinances may restrict or ban home delivery in specific substate jurisdictions.

Status of Home Delivery Policies
Exhibit 1.39 shows the number of states that permit, prohibit, or have no law regarding home delivery of beer, wine, and spirits. As the exhibit shows, 21 states and the District of Columbia permit home delivery of all three beverages, eight prohibit delivery of all three, and 13 have no law for any beverage. Eight states have differing laws for each of the three beverages. Of the states that permit home delivery, some place restrictions on retailers, including:
1. Requiring a state permit.
2. Restricting the volume that can be delivered.
3. Requiring clearly marked delivery vehicles.

Alaska is the only state that requires that orders must be in writing and that written information on fetal alcohol syndrome accompany the delivered product. Washington requires a special license for Internet orders. Exhibits 1.40–1.42 summarize the status of home delivery for beer, wine, and spirits as of January 1, 2019.
Trends in Home Delivery Policies
Between 2010–19, six states (Kentucky, Louisiana, Michigan, Tennessee, Vermont, and Washington) changed their home delivery policies. Louisiana permitted wine retailers to deliver to consumers in 2011. Washington permitted spirit retailers to deliver to consumers in 2012. In 2014, Tennessee permitted retailers to deliver beer, wine, and spirits. In 2017, Kentucky allowed the home delivery of all three beverage types, Vermont began to permit the home delivery of beer and wine, and Michigan permitted the delivery of spirits.

High-Proof Grain Alcoholic Beverages

Policy Description

This policy addresses state laws that prohibit or restrict the retail availability of high-proof grain alcoholic beverages as a strategy for reducing underage drinking, particularly underage binge drinking.

High-proof grain alcoholic beverages, such as Everclear or Gem Clear, represent a type of “neutral spirit” that is odorless, colorless, and contains a high percentage of alcohol. The Federal Alcohol and Tobacco Tax and Trade Bureau (TTB) defines “neutral spirits or alcohol” as “spirits distilled from any material at or above 95 percent alcohol by volume (190 proof), and if bottled, bottled at not less than 40 percent alcohol by volume (80 proof)” (TTB, 2007). High-proof grain alcoholic beverages pose particular risks for young people. They have little or no taste, odor, or color and are often added to cocktails, soft drinks, and fruit punch. This can result in an easy-to-consume concoction with very high alcohol content that is difficult to detect, particularly for people inexperienced at drinking, and can lead to binge drinking.

A “serving” of alcohol contains 0.6 ounces of ethanol, per NIAAA. This is the amount of ethanol contained in 1.5 ounces of traditional (40 percent alcohol by volume [ABV]) distilled spirits, 5 ounces of 12 percent ABV wine, and 12 ounces of 5 percent ABV beer. Grain alcohol, by contrast, contains approximately twice as much ethanol as traditional distilled spirits. Thus, an equivalent “serving” of grain alcohol would be 0.6 ounces of 95 percent ABV/190 proof or 0.8 ounces of 75.5 percent ABV/151 proof grain alcohol, respectively. This means there are 42 servings of 95 percent ABV/190 proof or 32 servings of 75.5 percent ABV grain alcohol in a 750mL bottle compared with only 17 servings in a bottle of other types of distilled spirits (such as vodka) of the same size. Research suggests that young people often “overpour” their drinks, making a strong drink even stronger (White et al., 2005). This practice can therefore be particularly hazardous when high-proof grain alcoholic beverages are involved.

More than two-thirds of youth binge drink (defined as five or more drinks in a sitting for men and four or more drinks in a sitting for women), and more than one-fifth of these youth do so frequently (NRC & IOM, 2004). Binge drinking “is associated with drunk driving, risky sexual behavior, physical and sexual assaults, injuries, and suicides” (Naimi et al., 2015).

Research has found that college students often consume grain alcohol when binge drinking. The Maryland Collaborative to Reduce College Drinking and Related Problems (“The Collaborative”) created and administered the Maryland College Alcohol Survey to 4,209 students from nine schools to measure levels of alcohol use and excessive drinking (The Collaborative, 2014). It found that, among students who had consumed alcohol in the past month, 70 percent reported binge drinking during that time period, with 11.6 percent reporting they consumed grain alcohol. Among people engaging in high-risk drinking (i.e., those who binge drank 1–4 days during the past month), 10.6 percent reported consuming grain alcohol over the last month. Among people who engage in very high-risk drinking (i.e., those who binge

21 Proof is a method of measuring the alcohol content of spirits calculated by multiplying the percent of ABV by two.
drank 5 or more days during the past month), 22 percent reported consuming grain alcohol over the last month.

Two studies looked at rates of high-proof grain alcoholic beverage consumption among all youth. According to an Internet panel of 1,032 youth ages 13–20, 5.8 percent of all youth reported consuming high-alcohol-content grain alcoholic beverages in the past 30 days (Siegel et al., 2014), and 2.4 percent of youth reported binge drinking such beverages in the past 30 days (Naimi et al., 2015).

Of youth who drank high-alcohol-content grain alcoholic beverages, 35.1 percent reported binge drinking. Naimi and colleagues (2015) also computed a market share ratio, the “proportion of binge reports accounted for by a particular alcohol type … or category … divided by its overall market share (i.e., percent of all drinks consumed) among the entire youth sample.” A number greater than 1.0 means “for a particular alcohol type or category, the number of binge drinking reports is disproportionately large relative to its market share.”

The market share ratio for high-proof grain alcoholic beverages was the fifth highest (out of 19 alcohol types or categories), at 1.59. Given the characteristics of this product and given that it is frequently mixed with punch or similar beverages, however, some youth may have consumed it unknowingly, and thus may not have reported consuming it in the studies, so the above statistics may underreport its consumption.

In many states, youth can easily obtain these beverages at low prices. The cost per ounce of ethanol for grain alcohol ranges from $0.52–$0.82. This is substantially lower than beer ($1.93 per ounce of ethanol), vodka ($1.85 per ounce of ethanol), or flavored alcoholic beverages ($2.14 per ounce of ethanol; DiLoreto et al., 2012). At this strength and price, grain alcohol provides one of the cheapest means to obtain a standard drink of alcohol and to engage in binge drinking.

**Types of Restrictions on Sale of High-Proof Grain Alcoholic Beverages**

Many states prohibit or restrict retail sale of high-proof grain alcoholic beverages. State statutes or regulations may restrict the type of such beverages that can be sold in the state. Control states, where the state government maintains direct control over the distribution and sale of alcoholic beverages at the wholesale and/or retail levels, may also regulate high-proof grain alcoholic beverages through internal policies that are not reflected in statute or regulation (i.e., by determining administratively that the beverages will not be made available at state-run wholesale and/or retail outlets).

States that regulate grain alcohol through internal policy, rather than by statute or regulation, are reported as restricting sales only if their internal policies are published in writing. Counties or municipalities may also regulate the sale of high-proof grain alcoholic beverages by local ordinance. Such restrictions are not included in this report.

**Current Status of Sale of High-Proof Grain Alcoholic Beverages**

Ten states regulate the sale of high-proof grain alcoholic beverages through statute, regulation, or written policy (see Exhibit 1.43). Six of these are license states: Alaska, California, Florida, Maryland, Minnesota, and Nevada. The other four are control states: North Carolina, Pennsylvania, Vermont, and Virginia. Two of the ten states offer exceptions to the restrictions.
Minnesota makes an exception for “spirits aged in wood casks for not less than 2 years.” Pennsylvania makes an exception for products produced by a “limited distillery license.”

Five states define the restrictions in terms of ABV. California prohibits the sale of beverages greater than 60 percent ABV. Alaska prohibits the sale of beverages greater than 76 percent ABV. Minnesota prohibits 80 percent ABV or more, and Nevada restricts grain alcohol with an ABV of over 80 percent. Maryland makes it illegal to sell grain alcohol with 95 percent ABV or more.

Four states define the restriction in terms of proof. Florida law provides that “[a] distilled spirit greater than 153 proof [76.5 ABV] may not be sold or consumed in the state.” The North Carolina ABC Commission has issued a written statement that the highest proof liquor sold in North Carolina ABC stores will be 151 proof (75.5 ABV). Pennsylvania restricts sales of alcohol at 190 (95 ABV) proof or greater to non-potable uses. In 2017, Virginia increased the upper limit of neutral grain spirit or alcohol sold in government stores from a proof of 101 to 151 [75.5 ABV]. Vermont simply restricts the purchase of “pure ethyl or grain alcohol” to non-beverage purposes.

Chapter 1: Best Practices–Evidence-Based Prevention Policies

Policies Affecting Alcohol Pricing

Alcohol Taxes

Policy Description

There is ample evidence that the “economic availability” of alcoholic beverages (i.e., retail price) affects underage drinking and a wide variety of related consequences. The Surgeon General’s Call to Action includes economic availability as a strategy in the context of increasing the cost of underage drinking (HHS, 2007). Taxes are a major way that alcohol prices are amended by policymakers, and increasing alcohol taxes has been recommended by the U.S. Community Preventive Services Task Force for effectively reducing excessive drinking, including among adults and underage drinking.22

The effects of price on reducing underage drinking, college drinking, and binge drinking (including drinking among youth who show signs of alcohol use disorders) are considerable. There are also significant effects on youth traffic crashes, violence on college campuses, and crime among people under 21.

Although alcohol taxes are an imperfect index of retail prices, tax rates are relatively easy to measure and provide a useful proxy for economic availability. Based on this and other research, the 2004 NRC/IOM report, Reducing Underage Drinking: A Collective Responsibility (NRC & IOM, 2004) made the following recommendation: “[S]tate legislatures should raise excise taxes to reduce underage consumption and to raise additional revenues for this purpose.” However, alcohol excise taxes have not kept up with inflation, reducing their value since the 1970s because of insufficient tax increases and infrequent tax increases (Blanchette et al., 2020).

This policy addresses beer, wine, and distilled spirits taxes. Although some states have separate tax rates for other alcoholic products (e.g., sparkling wine and flavored alcohol beverages), these account for a small market share and are not addressed.

Status of Alcohol Taxation

As of January 1, 2019, all license states have a specific excise tax for beer, wine, and spirits. The federal government also levies a specific excise tax of $0.58/gallon for beer, $1.07/gallon for wine, and $13.50/gallon for spirits.23

Like the federal-specific excise tax, state-specific excise taxes are generally highest for spirits and lowest for beer, roughly tracking the alcohol content of these beverages. Beer-specific excise taxes range from $0.02–$1.29/gallon, wine-specific excise taxes range from $0.20–$2.50/gallon, and spirits-specific excise taxes range from $1.50–$14.25/gallon. The states with

---

23 “Spirits are taxed at the rate of $13.50 on each proof gallon and a proportionate tax at the like rate on all fractional parts of a proof gallon. A proof gallon is one liquid gallon of spirits that is 50 percent alcohol at 60°F. Distilled Spirits bottled at 80 proof (40 percent alcohol) would be 0.8 proof gallons per gallon of liquid and taxed at a rate of $10.80 per gallon. Distilled Spirits bottled at 30 proof (15 percent alcohol) would be 0.3 proof gallons per gallon of liquid and taxed at a rate of $4.05 per gallon.”
the highest excise tax for one beverage may not be the states with the highest excise taxes for other beverages. States may control for one, two, or three categories (beer, wine, and spirits).

Exhibits 1.44–1.46 show the levels of excise taxes for beer, wine, and spirits across the 50 states and the District of Columbia. Exhibit 1.47 shows the ad valorem excise tax or sales tax adjusted ad valorem excise tax rates\textsuperscript{24} for license states that have ad valorem excise taxes. These may be levied at on- or off-sale outlets and may be for beer, wine, and spirits.

Beer ad valorem excise tax rates range from 1 percent to 14.95 percent for on- and off-premises sales. Wine rates range from 1.5 percent to 15 percent for on- and off-premises sales. Distilled spirit rates range from 1.5 percent to 37.50 percent for on- and off-premises sales. As shown in Exhibit 1.48, trade-off between retail ad valorem excise tax and sales tax is not uncommon.

**Trends in Alcohol Taxes**

Exhibit 1.49 shows the number of tax increases or decreases in beer, wine, or spirits excise taxes since 2003. These changes do not reflect increases or decreases in sales tax adjusted ad valorem excise tax rates that were caused only by a state’s change to its general sales tax.\textsuperscript{25} Changes also do not include the initial tax changes that occurred in 2011 when Washington changed from a control state to a license state. During this period, there have been 42 tax rate increases and ten decreases across all jurisdictions. A recent study noted that, measured in real-dollar terms to account for inflation, state alcohol excise taxes have declined about 30 percent since 1991, and now average about 5 cents per drink (Naimi et al., 2018). As a result, considering all types of taxes on alcohol, total alcohol taxes in 2010 accounted for just one-tenth of the costs due to excessive drinking in the U.S. (Blanchette et al., 2019)

\textsuperscript{24} The retail ad valorem excise tax minus the sales tax. Applicable only to states in which sales tax does not apply to alcoholic beverages in order to reflect the actual taxation rate.

All data for the three components of the “Alcohol Beverages Taxes” policy were obtained from the APIS websites:  https://alcoholpolicy.niaaa.nih.gov/apis-policy-topics/beer/30; https://alcoholpolicy.niaaa.nih.gov/apis-policy-topics/wine/32; https://alcoholpolicy.niaaa.nih.gov/apis-policy-topics/distilled-spirits/31. APIS provides further descriptions of this policy and its variables, details regarding state policies, and a review of the limitations associated with the reported data.

Low-Price, High-Volume Drink Specials

Policy Description

Restrictions on low-price, high-volume drink specials regulate on-premises retailers in their use of various price-related marketing tactics, such as “happy hours”, two-for-one specials, or free drinks, that encourage heavier consumption. These promotions are particularly prevalent in college communities, where large numbers of underage students are present.

Research has examined the effects of on-premises retail drink specials on binge drinking among college students. For example, one study measured self-reported binge drinking rates among college students from 119 colleges, conducted an assessment of marketing practices of on-premises outlets in neighboring communities, and determined whether these communities restricted low-price, high-volume drink specials. Results demonstrated that price-related promotions were significantly correlated with higher binge drinking and self-reported drinking and driving rates among students (Wechsler et al., 2003).

Based on this and other research, the Surgeon General’s Call to Action concluded that “increasing the cost of drinking can positively affect adolescent decisions about alcohol use,” and recommended “[e]limination of low price, high-volume drink specials, especially in proximity to college campuses, military bases, and other locations with a high concentration of youth” (HHS, 2007).

A state law concerning low-price, high-volume drink specials may prohibit or restrict the following practices:
1. Providing customers with free beverages either as a promotion or on a case-by-case basis (e.g., on a birthday or anniversary, as compensation for poor services).
2. Offering additional drinks for the same price as a single drink (e.g., two-for-ones).
3. Instituting a fixed price for an unlimited amount of drinks during a fixed period of time (e.g., “beat the clock” and similar drinking games).
4. Offering drinks with increased amounts of alcohol at the same price as regular-sized drinks (e.g., double shots for the price of single shots).
5. Service of more than one drink to a customer at a time.

Status of Low-Price, High-Volume Drink Specials Law

Exhibit 1.50 shows the number of states that prohibit one of the six low-price, high-volume specials listed above. As of January 1, 2019, 14 states prohibit free beverages. Four states prohibit multiple servings at one time. Nineteen states prohibit multiple servings for a single serving price. Twenty-four states prohibit unlimited beverages for a fixed price or period. Ten states prohibit increased volume without increase in price. As shown in Exhibit 1.51, seven states prohibit happy hours (reduced prices). Nine additional states allow happy hours but restrict the hours in which they may be offered.
Chapter 1: Best Practices–Evidence-Based Prevention Policies

Exhibit 1.50: Number of States Prohibiting Various Low-Price, High-Volume Drink Specials as of January 1, 2019

Exhibit 1.51: Happy Hours as of January 1, 2019

- States That Allow Happy Hours
- States That Prohibit Happy Hours
- States That Allow But Restrict Happy Hours
Trends in Low-Price, High-Volume Drink Specials Law

Since 2011, one state (Pennsylvania) has increased the number of hours during which discounts may be offered. In 2012, Kansas changed its law to allow reduced-price drinks during designated times of day and increased volume of an alcoholic beverage. In 2015, Illinois changed its prohibition against multiple servings at one time to prohibiting multiple servings for a single serving price. At the same time, Illinois lifted its ban of “happy hour pricing” that prohibited discounting drinks during the day to permitting drink discounts before 10 p.m., provided the discounts do not exceed 4 hours per day and 15 hours per week. As of January 1, 2019, Oklahoma repealed its happy hour ban pertaining to drinks specials.

All data for the “Drink Specials” policy were obtained from the APIS website: https://alcoholpolicy.niaaa.nih.gov/apis-policy-topics/drink-specials/2. APIS provides further descriptions of this policy and its variables, details regarding state policies, and a review of the limitations associated with the reported data.

Wholesaler Pricing Restrictions

The 21st Amendment to the Constitution repealed Prohibition and gave states broad authority to regulate alcohol sales within their borders. Most states established a three-tier structure: Producers, wholesalers, and retailers. Many states included restrictions on wholesaler pricing practices intended to strengthen the three-tier system, reduce price competition among wholesalers and retailers, and combat corruption and crime in the alcohol market.

Research suggests that the specific wholesaler pricing restrictions described below increase the price of alcohol to consumers. Research also shows that underage consumption and problems are strongly influenced by alcohol prices. One study has suggested that restrictions on certain wholesale pricing practices may have as strong an effect on alcohol pricing as alcohol taxes (Chaloupka, 2010).

Some states operate alcohol wholesale operations directly through a state agency, usually limited to distilled spirits, beer with high alcohol content, and wine with high alcohol content. In these cases, the state sets wholesaler prices as part of its administrative function, and statutory provisions are relevant only to that portion of the wholesaler market in the control of private entities. For this policy, an index beverage (defined by alcohol content) has been selected: Beer (5 percent), wine (12 percent), and spirits (40 percent). If the index beverage is controlled, in whole or in part, by the state at the wholesale level, the state is defined as a “control” state. If an index beverage is not controlled by the state at the wholesale level, that state is defined as a “license” state.

For the purpose of describing wholesale pricing restrictions, a state may be both “control” and “license,” depending on the beverage. One state, Utah, is defined as a control state for all three beverage indexes because that state limits the sale of beer by private businesses to beer with alcohol content no higher than 4 percent.

Types of Wholesaler Pricing Policies

In general, wholesaler pricing policies fall within four types: (1) Restrictions on volume discounts, (2) restrictions on discounting practices, (3) price posting requirements, and (4) restrictions on the ability of wholesalers to provide credit extensions to retailers. Policy categories are closely interrelated but may operate independently of each other. Each is described briefly below.

Volume Discounting Restrictions

Large retailers often have an advantage over smaller retailers due to the large volumes they are able to purchase at once. This purchasing power allows them to negotiate lower prices on most commodities and therefore offer items at lower prices to consumers. Many states have imposed restrictions on the ability of wholesalers to provide volume discounts—the same price must be charged for products regardless of the amount purchased by individual retailers. The primary purpose of these laws is to protect small retailers from predatory marketing practices of large-volume competitors and to prevent corruption. They have a secondary effect of increasing retail prices generally by making retail price discounting more difficult.

26 For a state-by-state review of control state wholesaler systems and further discussion of license systems, see http://www.apis.niaaa.nih.gov.
Minimum Pricing Requirements

States may require wholesalers to establish a minimum markup or maximum discount for each product sold to retailers based on the producer’s price for the product, or states may enact a ban against selling any product below cost. These provisions are designed to maintain stable prices on alcohol products by limiting price competition at both retail and wholesale levels. In most cases, this increases the retail price to consumers, and thus affects public health outcomes.

This policy requires wholesalers to publicly “post” prices of their alcohol products (i.e., provide a list of prices to a state agency for review by the public, including retailers and competitors) and hold these prices for a set amount of time, allowing all retailers the opportunity to make purchases at the same cost.

Post-and-hold requirements are typically tied to minimum pricing and price discounting provisions and enhance the states’ ability to enforce those provisions. Wholesalers’ submissions can be reviewed easily to determine whether they are paying the proper taxes on their products and whether they are providing any illegal price inducements to retailers. Post-and-hold provisions reduce price competition among both retailers and wholesalers because posted prices are locked in for a set amount of time. They also promote effective enforcement of other wholesaler pricing policies. Some states require wholesalers to post prices but have no “hold” requirement—that is, posted prices may be changed at any time. This is a weaker restriction.

Credit Extension Restrictions

Wholesalers often provide retailers with various forms of credit (e.g., direct loans or deferred payment of invoices). Many states restrict alcoholic beverage wholesalers’ ability to provide credit to retailers, typically by banning loans and limiting the period of time required for retailers to pay invoices. The primary purpose of the restrictions is to limit the influence of wholesalers on retailer practices. When a retailer is relying on a wholesaler’s credit, the retailer is more likely to promote the wholesaler’s products and to agree to the wholesaler’s demands regarding product placement and pricing. Restrictions have a secondary effect of limiting the retailer’s ability to operate on credit, indirectly increasing retail prices.

Federal Court Challenges to State Wholesaler Pricing Restrictions

As noted earlier, in general, states have broad authority under the 21st Amendment to the Constitution to regulate alcohol availability within their boundaries. That authority has been constrained by U.S. Supreme Court and Federal Court of Appeals cases, which have interpreted the Interstate Commerce Clause and Sherman Antitrust Act to prohibit certain state restrictions on the alcohol market. These cases have led to considerable uncertainty regarding the

---

28 See, for example, California Retail Liquor Dealers Assn. v. Midcal Aluminum, Inc., 445 U.S. 97, 100 S.Ct. 937 (1980).
29 Several federal and state courts have addressed the constitutionality of selected wholesaler pricing practices, with conflicting results. For example, in Costco Wholesale Corp. v. Maleng, 522 F.3d 874 (9th Cir. 2008), the plaintiff challenged nine distinct Washington state restrictions governing wholesaler practices, including policies in all four categories described above. The court upheld the state’s volume discount and minimum markup provisions
validity of state restrictions on alcohol wholesaler prices, and additional challenges to those restrictions are anticipated. In the meantime, this uncertainty has prompted states to re-examine their alcohol wholesaler practices provisions.

Status of Wholesaler Pricing Restrictions

**Federal Law**

Federal law addresses restrictions on wholesaler credit practices:

Some states allow wholesalers to extend credit to retailers for a longer period than is permitted under federal law.

**State Law as of January 1, 2019**

Exhibits 1.52–1.55 show summary distributions of volume discounts, minimum markup/maximum discount, post-and-hold, and retailer credit for the license states (beer, 50 license states; wine, 43 license states; spirits, 34 license states). Only two license states (Alaska and Rhode Island) have no wholesaler pricing restrictions. Among the remaining states, bans on extending credit and post-and-hold (excluding post only) are the most common wholesaler pricing restrictions (ranging from about one-fifth to about one-half the states depending on beverage type). Other restrictions range from under 10 percent of the license states to about a quarter of the states depending on beverage type.

**Trends in Wholesaler Pricing Restrictions**

In 2016, two states modified their post-and-hold provisions. Delaware changed its regulatory requirement from a post-and-hold law of 5 days to a post-only requirement for all three beverage subtypes. Additionally, Michigan reduced the time of its minimum number of days to hold prices from 180 days to 90 days for wholesale pricing of beer. In 2019, Oklahoma eliminated the post-and-hold requirement for beer as it pertains to wholesale pricing.

Exhibits 1.56–1.59 present detailed state-by-state information for wholesaler pricing policies for beer.

---

but invalidated the post-and-hold requirements. In *Manuel v. State of Louisiana*, 982 So.2d 316 (3rd Cir. 2008), a Louisiana appellate court rejected six separate challenges to the Sherman Act, including the ban on volume discounts. It upheld the state’s ability to regulate alcoholic beverages within the state and concluded that the Sherman Act had to yield to the state’s authority granted under the 21st Amendment. Maryland’s post-and-hold law and volume discount ban were challenged in *TFWS, Inc. v. Franchot*, 572 F.3d 186 (4th Cir. 2009), a complicated case involving multiple appeals and rehearings. On Maryland’s fourth appeal, the court upheld its previous decisions to strike down the two policies.

Comparisons among beverage types must be made with some caution because the number of license states differs for each beverage.

CHAPTER 2

The Importance Of Enforcement In Preventing Underage Drinking
CHAPTER 2: THE IMPORTANCE OF ENFORCEMENT IN PREVENTING UNDERAGE DRINKING

Introduction

As noted in the Introduction, successful implementation of the 26 policies covered in Chapter 1 is tied to the enforcement actions taken to ensure compliance. A significant component of the Sober Truth on Preventing Underage Drinking (STOP) Act’s mission is to collect data and report on each state’s performance in enforcing policies designed to prevent or reduce underage drinking.

To that end, the annual STOP Act State Survey includes a section devoted to enforcement of these laws and covers the types of programs or actions implemented, whether they are conducted at both the state and local level, number(s) of enforcement actions taken (when available), state expenditures on enforcement activities, and more. The following discussion of enforcement provides the background and context for these data.

Concepts

Mechanisms

Typically, an alcohol policy seeks to change the behavior of targeted individuals, groups, or organizations. The intended change in behavior may or may not occur, depending in part on the extent to which the policy is enforced.

It is important to distinguish between compliance and enforcement. Compliance is the extent to which an individual, organization, group, or population acts in accordance with a specific public policy. Enforcement is the sum total of actions taken by public entities to increase compliance. Enforcement includes three components: Policing, adjudication, and sanctioning. Enforcement data collected by the STOP Act State Survey generally combine adjudication and sanctioning because the latter usually requires the former.

The role of enforcement in policy effectiveness varies depending on the nature of the policy. At one extreme, policies such as alcohol taxes are virtually self-enforcing in that sellers must regularly report sales data. By contrast, laws that prohibit sales to minors require relatively high enforcement levels to achieve desirable levels of compliance. For the latter, detecting a violation may require regular compliance checks and recording sources of alcohol from minor in possession (MIP) arrests.

The effect of enforcement on compliance with alcohol policies is a function of both actual and perceived levels of enforcement (i.e., levels of policing, adjudication, and sanctioning). Actual enforcement levels may vary depending on the strategies employed (e.g., random versus complaint-based compliance checks) and on quantitative differences in policing, adjudication, and sanctioning (e.g., numbers of officers on patrol, severity of sanctions). Perception of the probability of apprehension (policing), swiftness and certainty of a penalty (adjudication), and severity of the penalty (sanctioning) also affect compliance with a particular policy. These perceptions are key factors in the extent to which an alcohol-related policy functions as a deterrent to illegal behavior (Ross, 1992). Factors that affect these perceptions, such as publicity about enforcement efforts, may be construed as part of enforcement (Hingson et al., 1996). Compliance may also be affected by extra-legal factors (See Exhibit 2.1).
<table>
<thead>
<tr>
<th>Variable</th>
<th>Relevance to Enforcement</th>
<th>Relevance to Compliance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Knowledge and awareness of enforcement personnel and the public</td>
<td>Enforcement personnel who lack knowledge of a law or policy or lack skill in using enforcement technologies (e.g., field identification of intoxication) may be less effective in enforcement activities.</td>
<td>Increasing public awareness of the existence or enforcement of a policy and efforts to enforce it tend to increase compliance.</td>
</tr>
<tr>
<td>Costs</td>
<td>Increasing costs of enforcement (either absolute or relative to benefits) can decrease the attractiveness of an enforcement effort to policymakers, who must balance enforcement against other priorities.</td>
<td>Policy complexity may tend to reduce compliance if: (1) The burden of complying is increased in terms of details that must be addressed, work that is required, or costs that must be incurred or (2) the risk that non-compliance with specific provisions will be detected is perceived as low.</td>
</tr>
<tr>
<td>Complexity</td>
<td>All else being equal, complex laws or policies may be more difficult to enforce (detect and prosecute) than simple laws or policies.</td>
<td>When laws or policies are complex, compliance may be reduced: (1) Due to the sheer amount of detail involved in complying, (2) due to the work and cost involved in complying, or (3) if the risk of detection of small deviations is low.</td>
</tr>
<tr>
<td>Norms</td>
<td>Enforcement personnel tend to act in accordance with prevailing norms, more vigorously enforcing laws and policies prohibiting behavior that is counternormative in a given community than behavior that is socially acceptable.</td>
<td>Avoidance of specific behaviors may be as much a function of social acceptability as of legal proscriptions. Thus, for a given level of enforcement, compliance may vary as a function of community norms.</td>
</tr>
<tr>
<td>Public support</td>
<td>Public officials who advocate strong enforcement, or formal or informal cooperation between citizens and public safety officials.</td>
<td>Public support is a visible manifestation of norms. As such, public support for a given law or policy should tend to increase compliance.</td>
</tr>
</tbody>
</table>

---

31 Adapted from the National Institute on Alcohol Abuse and Alcoholism’s (NIAAA) Alcohol Policy Information System: Enforcement and Compliance Resource, Table 3 (Sample Contextual Factors) [http://alcoholpolicy.niaaa.nih.gov/uploads/Table_3_-_Sample_Contextual_Factors_12_18_07.pdf](http://alcoholpolicy.niaaa.nih.gov/uploads/Table_3_-_Sample_Contextual_Factors_12_18_07.pdf).
A large body of literature addresses the factors related to effective enforcement (Klitzner, 2002; Klitzner & Sole-Brito, 2002; Levy, 2002). It is important to note that policies and their enforcement cannot be distinguished easily in practice. Laws may specify sanctions (e.g., use/lose laws) or enforcement practices (e.g., administrative license revocation).

According to Ross (1984), deterrence theory is the most widely used model of enforcement effectiveness. This theory stipulates that undesirable behavior will be reduced by the extent that those targeted by enforcement activities (e.g., alcohol retailers) perceive that threatened sanctions are certain, severe, and promptly imposed (celerity). Ross argued that severity is largely irrelevant when certainty of punishment is low and, conversely, that even mild penalties have a deterrent effect when sanctions are a near certainty (e.g., parking enforcement).

As noted by Klitzner and Sole-Brito (2002), Ross is essentially stating that deterrence is a multiplicative function of the perceived risk of being punished and the perceived severity of penalties. The importance of celerity is debatable, because the most commonly cited example (administrative license revocation for impaired driving offenses) increases both celerity and certainty. Although deterrence literature is largely focused on criminal activity, the same concepts apply in a variety of other areas not generally considered criminal, for example, compliance with health care regulations (Bartrum & Bryant, 1997; Walker, 2002).

Nagin (2013) argues that, because the evidence supporting the effect of certainty is linked almost exclusively to apprehension probability (perception), certainty of apprehension, rather than severity, is more effective as a deterrent. In this model, the effect of certainty stems primarily from law enforcement functioning in their guardian or sentinel role, rather than in their apprehension agent role.

Deterrence is generally divided into two types—deterrence aimed at convicted offenders (secondary or specific deterrence) and deterrence aimed at the general public (primary or general deterrence). Incapacitation (e.g., supervision; incarceration; a number of hybrids, such as electronic monitoring and license revocation) is a widely used form of specific or secondary deterrence in the United States. Whatever effects incapacitation may have on individuals’ propensity to engage in future crime, they are less likely to recidivate while incarcerated or under supervision.

Vingilis (1990) suggested that the importance of classical deterrence diminishes as norms against a behavior increase. Social norms may change through social marketing or other media campaigns (e.g., aimed at reducing drinking and driving), altering the dynamic of deterrence. When norms are strong, only those who are “abnormally socialized” need an additional motivation to behave. The author argues that the behavior of most citizens is governed by informal social sanctions, and cautions that: (1) Effective enforcement and deterrence are interactions among individuals and environments, and (2) deterrence is dynamic, with the population that is deterred by a given enforcement activity constantly in flux.

**Measures**

Research literature relies on three types of measurements to assess the extent and effectiveness of enforcement interventions. Categorical measures assess which of a set of possible enforcement

---

32 An example of the guardian/sentinel role would be the presence of a police car outside of a business as a deterrent to theft.
Chapter 2: The Importance Of Enforcement In Preventing Underage Drinking

strategies (e.g., random versus complaint-based compliance checks) or sanctions (e.g., use/lose penalties) are implemented in a jurisdiction. Quantitative measures assess the resources devoted to enforcement (e.g., personnel, budgets, specialized equipment), number of enforcement activities (e.g., shoulder tap operations) conducted, number or percentage of persons or entities targeted, number of sanctions imposed, and severity of sanctions imposed. These measures are sometimes referred to as “enforcement pressure.” Surrogate measures use compliance rates (e.g., number of retail outlets that fail compliance checks, number of MIP arrests, number of young people and retailers that actually receive sanctions) to measure enforcement. These measures reflect an amalgam of both enforcement and compliance and should be viewed with some caution.

The ability to measure the effect of enforcement on efficacy may also vary depending on such factors as the type of agency responsible for enforcement. Enforcement of alcohol policies takes place largely at the state level, through alcohol control or other agencies, and at the local level, through municipal and other enforcement agencies. A substantial portion of underage drinking law enforcement occurs at the local level, yet local enforcement data are typically difficult to obtain (Erickson et al., 2013; Rutledge et al., 2013). Further, enforcement may be mediated through other non-enforcement agencies, such as health and human services agencies tasked with the care and treatment of individuals who may be in violation of the law. A study of the implementation of state alcohol and pregnancy policies found that, with respect to policies requiring reporting of alcohol use during pregnancy, implementation was inconsistent and mediated by health practitioners’ uneven knowledge of the law itself, as well as their concern for the well-being of their patients should they be reported to an enforcement agency (Thomas et al., 2015).

Literature

Historically, studies that have tested enforcement interventions in relation to outcomes (e.g., incidents of drinking and driving and underage drinking parties) make clear that enforcement can result in greater compliance and better public health outcomes (Preussser & Williams, 1992; Smith et al., 2014). However, enforcement of underage drinking policies is often uneven, inconsistent, and sporadic, and outcomes generally diminish over time (Ferguson et al., 2000; Forster et al., 1994; Montgomery et al., 2006; Mosher et al., 2002; Preussser & Williams, 1992; Voas et al., 1998; Wagenaar & Wolfson, 1995; Wolfson et al., 1995).

Of all enforcement practices, compliance checks (or decoy operations) have been most frequently studied (and are one focus of the STOP Act State Survey data presented later in this report). These practices, in which trained underage (or apparently underage) operatives (“decoys”) working with law enforcement officials enter retail alcohol outlets and attempt to purchase alcohol, are a way of reducing sales of alcohol to minors. The 2003 National Research Council (NRC)/Institute of Medicine (IOM) report on preventing underage drinking (NRC & IOM, 2004) includes the recommendation that compliance checks be carried out regularly and comprehensively at the state and local levels. The 2016 Facing Addiction in America: The

---

33 To be fully useful as measures of enforcement, these data must be corrected for enforcement pressure. However, measures of enforcement pressure can be difficult and expensive to obtain. Accordingly, arrests, compliance check failures, and similar data are often used in enforcement research.
Surgeon General’s Report on Alcohol, Drugs, and Health (HHS, 2016) describes the use of compliance checks as “an effective way to reduce alcohol consumption by minors.”

The effectiveness of compliance checks depends on consistency. To illustrate, a national study collected data from state alcohol beverage control agencies and a random sampling of local law enforcement agencies (Erickson et al., 2013; Rutledge et al., 2013). Respondents were asked to report on the number of compliance checks they conducted and on such recommended practices as: (1) Checking all outlets in their jurisdiction, (2) conducting checks at least three or four times a year, and (3) conducting a follow-up check of establishments within 3 months of having failed a compliance check. Thirty-nine percent of local agencies and 79 percent of state agencies indicated they conducted compliance checks (Toomey et al., 2012). Although 60 percent of the agencies reported checking all outlets in their jurisdiction, only one-fifth conducted checks three to four times a year, and one-third conducted follow-up checks. Only 4 percent to 6 percent conducted all three recommended practices (Erickson et al., 2014). As with previous studies, the use of compliance checks to enforce underage sales policies was found to be uneven and inconsistent in intensity.

A number of studies have used experimental designs to determine whether increasing the number of compliance checks results in lower rates of sales to minors. The NIAAA-funded Community Trials Project conducted experimental interventions to reduce underage drinking in three cities, including a six-fold increase in compliance checks in a randomly selected group of test outlets. At follow-up, the test outlets were half as likely to sell to minors as control sites (Grube, 1997).

In Concord, New Hampshire, an enhanced enforcement campaign employed quarterly compliance checks of all off-sale licensees, enhanced administrative penalties, and a media campaign (Centers for Disease Control and Prevention, 2004). Similar to the Community Trials Project, this campaign resulted in a 64 percent reduction in sales to minors and a temporary reduction in alcohol consumption and binge drinking among high school students.

A multi-community time series trial, Complying with the Minimum Drinking Age (CMDA), also tested increased enforcement compliance checks, comparing this strategy with training retail outlet managers to reduce risks associated with alcohol sales (Wagenaar et al., 2005). Although the effects of the training program were mixed, the compliance check intervention resulted in an immediate 17 percent reduction in underage sales. Over a 3-month period, however, these effects deteriorated completely in the case of off-sale premises and by half among on-sale premises. Data from the CMDA study also demonstrated that the effects of compliance checks may spill over to neighboring establishments (Erickson et al., 2013). Outlets that had a close neighbor that had been checked were less likely to serve to underage-appearing decoys.

Some of these experimental studies have included media campaigns to increase: (1) Public awareness of enforcement efforts, (2) the perception of risk of arrest, or (3) the perception of risk of sanctions. As discussed above, these perceptions can play an important role in compliance with the law. When community-based interventions to prevent underage drinking or other alcohol-related harms include a media campaign, this may increase public perception of the likelihood that the law will be enforced and violators sanctioned.

The comprehensive, multi-faceted Saving Lives Program was undertaken in six Massachusetts communities to reduce alcohol-impaired driving and related problems (Hingson et al., 1996). In
addition to enhanced enforcement and educational programs, media campaigns were implemented to increase public awareness of the issue. Among other results, these communities showed a 42 percent decline in alcohol-related fatal crashes relative to the rest of the state. Awareness of enforcement notably increased among teenagers. For example, the percentage of this group that believed the license of a person caught drinking and driving could be suspended before a trial increased from 61 percent to 76 percent in the test communities compared with no change in the rest of the state.

The Community Trials Project discussed above also combined enhanced enforcement with local media coverage. Highly visible enhanced enforcement, such as roadside checkpoints, also served to increase both actual enforcement and perceived risk of arrest (Grube, 1997; Holder et al., 2000). This combination of environmental strategies resulted in lower volumes of self-reported drinking and fewer nighttime crashes.

Another experimental study in 36 Oregon communities tested interventions that combined community mobilization, “reward and reminder” compliance check visits, and media advocacy to gauge the impact of these strategies on underage drinking rates (Flewelling et al., 2013). Prior to the compliance check phase, selected off-premise establishments received educational visits where they were given informational packets about the study and signage and other resources for their store. The reward-and-reminder visits consisted of young volunteers attempting to make alcohol purchases. If they asked for identification, clerks received a congratulatory letter and a gift certificate. If identification was not requested, the clerk received a reminder notice. Although the overall intervention was found to be effective in reducing the likelihood of clerks selling to buyers who appeared underage, it did not result in a reduction in underage drinking. However, there were significant associations between the intensity of enforcement implementation and reductions of underage drinking and binge drinking.

As implied above, a key determinant of enforcement effectiveness is the resources devoted to enforcement actions. A study that examined the relationship among underage alcohol policies in 50 California cities, enforcement of these policies, and adolescent alcohol use identified an inverse relationship between the funding of enforcement of underage drinking laws and frequency of past-year underage alcohol use (Paschall et al., 2012). Similarly, a study of binge drinking among college students found a significant association between binge drinking rates and state ratings for resources devoted to enforcement (Nelson et al., 2005).

The presence (or absence) of community resources alone, however, does not necessarily determine the strength of alcohol enforcement efforts. As a national survey of local law enforcement agencies suggests, the will or pressure to enhance enforcement may bring about stronger efforts, regardless of a community’s relative economic disadvantage (Erickson, et al, 2015). This study found that agencies with an officer assigned specifically to alcohol enforcement, and agencies that perceived underage drinking, impaired driving, or over-service as more common, were more likely to fall into a class of agencies characterized by high levels of alcohol enforcement activity, irrespective of community characteristics.

**Practices**

The STOP Act State Survey includes questions about the practices used by the states and (to the extent known) by local law enforcement to enforce underage drinking policies. Whether at the
point of sale or through other forms of illegal access to alcohol, these practices aim to both prevent current underage possession and consumption and deter future incidents.

In addition to compliance checks (discussed above), two other enforcement strategies are employed at the point of sale to prevent youth access to alcohol: Cops in Shops and shoulder tap operations (NRC & IOM, 2004; Paschall et al., 2009; Pacific Institute for Research and Evaluation, 2011). In the Cops in Shops program (developed by the Century Council and sponsored by the alcohol industry), undercover law enforcement officers pose as employees or customers in retail alcohol outlets to catch underage persons who attempt to purchase alcohol or adults who purchase alcohol for minors. Cops in Shops campaigns involve voluntary participation of retailers and are often well publicized, with the goal of educating the public and deterring underage access to alcohol.

Shoulder tap operations are another type of decoy operation. Because young people may perceive asking an adult to purchase alcohol for them as a less risky strategy for obtaining alcohol, this is another important point of access for law enforcement to address. In actual transactions, both the underage person and the adult are in violation of the law. In shoulder tap operations, trained young people (decoys) approach individuals outside of retail alcohol outlets and ask them to make an alcohol purchase. If the adult makes the purchase and gives it to the decoy, law enforcement may cite or arrest the adult.

Away from the point of sale, youth frequently are able to access alcohol at parties or other social gatherings. Parties are often cited as a high-risk setting for underage alcohol consumption and are linked to impaired driving, violence, and property damage (Hoover, 2005). In response, many local law enforcement agencies have used party patrols to intervene. Party patrol (or party dispersal) operations are patrols that identify underage drinking parties, make arrests, and issue citations. Police may use local noise or nuisance ordinances as the basis for entering the premises of parties involving underage drinking. They may also conduct regular weekend patrols of locations where underage parties or gatherings are known to occur (NRC & IOM, 2004).

Data collected by the STOP Act State Survey provide greater insight into the use of such practices (e.g., compliance checks, Cops in Shops, shoulder tap operations, party patrols) by states and local jurisdictions. Together with the data collected on MIP arrests, penalties imposed for sales to minor violations (e.g., fines, license suspensions, revocations), and state expenditures on enforcement, they provide a more detailed picture of the underage drinking enforcement environment at both the state and national levels.
CHAPTER 3
Enforcement And Prevention Activities—2019 State Survey Results
CHAPTER 3: ENFORCEMENT AND PREVENTION ACTIVITIES—2019 STATE SURVEY RESULTS

Introduction

The 2006 Sober Truth on Preventing Underage Drinking (STOP) Act requires annual reporting of data from the 50 states and the District of Columbia on their performance in enacting, enforcing, and creating laws, regulations, and programs to prevent or reduce underage drinking. The STOP Act State Survey was developed to efficiently collect the portions of this data that were not available elsewhere.

Administered since 2011, the STOP Act State Survey has collected data on the following topics:
1. Enforcement programs to promote compliance with underage drinking laws and regulations.
2. Programs targeted to youth, parents, and caregivers to deter underage drinking.
3. State interagency collaborations to implement prevention programs, best-practice standards, and collaborations with tribal governments.
4. The amount that each state invests on the prevention of underage drinking.

A key conclusion from State Survey responses is that states are committed to the reduction of underage drinking and its consequences. Evidence of this commitment can be seen by the following:
1. All states completed the 90-question survey,
2. Most reported numerous program activities,
3. In many cases, states provided substantial detail about those activities (see individual state summaries).

Results presented here must be viewed with caution. In many cases, missing data decrease the extent to which a meaningful conclusion can be drawn. Caution must also be exercised in interpreting changes from 2011–2019, given variations in data availability.

Enforcement Programs

The majority of states collect data on state compliance checks, minor in possession (MIP) charges, and penalties imposed on retail establishments. However, only one-quarter of the states collect data on local enforcement efforts. Thus, the ability to draw conclusions about enforcement activities and effectiveness is limited because underage drinking law enforcement also occurs at the local level. Improvements in state enforcement data systems would increase the accuracy of these analyses in future years.

Overall, enforcement activities appear highly variable across states. Compliance checks and other enforcement activities related to furnishing (i.e., party patrol operations, underage alcohol-related fatality investigations, and enforcement of direct shipment laws) are fairly widely implemented, although not necessarily at both state and local levels. The total number of checks is modest, however. Fifty-nine percent of those states conducting compliance checks test 20 percent or fewer of their licensees. Sanctions for furnishing are predominantly fines, which are about six times more common than suspensions. Revocations are extremely rare; 69 percent of the states in which license revocation is an option reported revoking one or no licenses.

Data on MIP activities (an index of the enforcement of a variety of laws aimed at deterring underage drinking) revealed medians of 0.73 arrests per 1,000 underage drinking occasions, and 788 arrests per 100,000 in a population of 16- to 20-year-olds.
Programs Targeted to Youth, Parents, and Caregivers

States reported implementing a wide variety of underage drinking prevention programs for youth, parents, and caregivers. Many well-known programs were reported, including those focused on life skills, refusal skills, media advocacy, community organizing, and environmental change. Half of the programs focused on individuals, whereas one in five programs focused on environmental change.

Data on numbers of program participants were limited, owing perhaps to inherent difficulties in estimating program participation for programs focused on entire populations or subpopulations (e.g., environmental change programs). Forty-three percent of the states reported implementing programs to measure or reduce youth exposure to alcohol advertising and marketing.

Evaluation of underage drinking prevention programs is not comprehensive. Forty-three percent of the programs the states described have been evaluated, and reports are available for 52 percent of these. As with enforcement, assessments of program effectiveness are limited by a lack of relevant data.

Ninety percent of the states reported they had best-practice standards for underage drinking prevention programs. Seventy-eight percent of states with best-practice standards reported that a federal agency had contributed to establishing these standards, and 72 percent indicated that their standards were based on guidelines developed by a state agency. Close to three-quarters (74 percent) included the Substance Abuse and Mental Health Services Administrations (SAMHSA) or SAMHSA’s Center for Substance Abuse Prevention (CSAP) in their list of agencies from which standards were obtained.

Collaborations, Planning, and Reports

Seventy-one percent of states reported the existence of a state-level interagency body or committee to coordinate or address underage drinking prevention activities. However, of the states with such a committee, only 11 percent included the governor, and 11 percent included a representative of the legislature.

Forty-six percent of the states with interagency committees included community coalitions, and 46 percent included college or university administrations, campus life departments, or campus police. Fourteen percent of the states included local law enforcement, and only 11 percent included youth. Overall, key decisionmakers (e.g., governors, legislatures) were underrepresented on interagency committees.

States were asked whether they had prepared a plan for preventing underage drinking or issued a report on underage drinking in the past 3 years. Fifty-five percent of the states had prepared a plan, and 49 percent had issued a report.

State Expenditures on the Prevention of Underage Drinking

States were asked to estimate state expenditures for two categories of enforcement activities and five types of programs targeted to youth, parents, and caregivers. Responses indicate that the largest expenditure category is for community-based programs, followed by K–12 programs. The median of expenditures for programs targeted to youth, parents, and caregivers ($134,206) is twice that for all enforcement activities (median = $59,607), and the total dollar amount
expended for these non-enforcement programs ($148,033,549) is 16 times the total dollar amount spent on enforcement ($9,322,436). Data reporting was incomplete, with response rates ranging from 27 percent to 82 percent (median = 61 percent) across the five expenditure categories for programs targeting youth, parents, and caregivers. Thus, these results must be viewed with some caution. However, these data may be difficult for states to assemble, given multiple funding streams and asynchronous fiscal years, among other issues.

It should be noted that the total dollar amount reported in the state survey—for enforcement or other programs—reflects only funds from the state’s budget and represents only a relatively small portion of total state spending on substance use prevention. Each state receives substantial federal funding (through block grants and other sources) that is used for underage drinking prevention and treatment and as well as substance misuse prevention generally. Each of the 51 State Reports includes a pie chart showing sources of funds spent by the state on substance misuse prevention and treatment.

Comparison of Enforcement Data: 2011–19

The STOP Act State Survey has been implemented for 9 years (2011–19), and during that 9-year period, states have varied greatly in their completion of datasets. Fewer than half of the states provided information in all 9 years for all of the enforcement data categories selected for comparison.

Forty-five percent of the states provided state compliance check data for all 9 years. Sixty-one percent of the states that reported data for all 9 years reported an increased number of compliance checks between 2011 and 2019. Only 4 percent of the states reported on local compliance checks and only 2 percent on state expenditures for compliance checks in all 9 years.

Comment

The data reveal a wide range of activity in the areas studied in the survey, although the activities vary in scope and intensity from state to state. Clearly, all states have areas of strength and areas where improvements can be realized. A recurrent theme is the unavailability of some data requested in the survey, especially that pertaining to local law enforcement and statewide expenditures. Accurate and complete data are essential both for describing current activities to prevent underage drinking and for monitoring progress in future state surveys.

Survey Instrument

The survey instrument consists of approximately 90 questions divided into the four sections described below, consistent with the topics and performance measures described in the STOP Act.

1. Enforcement of underage drinking laws, including:
   a. The extent to which states implement checks of retail outlets to assess compliance with laws prohibiting the sale of alcohol to minors and the results of these checks.
   b. The extent to which the states implement other strategies for underage drinking enforcement, including MIP, Cops in Shops, shoulder tap operations, party patrol operations or programs, and underage alcohol-related fatality investigations.
   c. Sanctions imposed for violations (e.g., fines, license suspensions, license revocations).

34 A copy of the survey instrument can be found on stopalcoholabuse.gov (Supplemental Materials to the Report to Congress)
2. Underage drinking prevention programs targeted to youth, parents, and caregivers, including data on the number of people served by these programs and whether these programs are evaluated.

3. State interagency collaborations to implement prevention programs, best-practice standards, and collaborations with tribal governments.

4. State support of, and participation in, media campaigns to reduce underage drinking, including the “Talk. They Hear You.” campaign, a national media campaign required by the STOP Act.  

5. State funds spent in the following categories, along with descriptions of any dedicated fees, taxes, or fines used to raise funds:
   a. Compliance checks and provisions for technology to aid in detecting false identifications at retail outlets.
   b. Checkpoints and saturation patrols.
   c. Community-based, school-based, and higher education-based programs.
   d. Programs that target youth within the juvenile justice and child welfare systems.
   e. Other state efforts as deemed appropriate.

Survey questions are structured to allow states maximum flexibility in deciding which initiatives to describe and how to describe them. Open-ended questions are used whenever possible to allow states to “speak with their own voices.” The survey provides the option to respond “Don’t Know” or “Data Not Available” in those instances where requested information is not accessible.

**Methods**

State governors and the District of Columbia’s mayor were sent letters requesting confirmation of a designated representative to serve as the contact and be responsible for completing the survey. Designated contacts are typically staff members from state substance misuse program agencies or state alcohol beverage control (ABC) agencies.

The survey was uploaded to a web-based platform in four segments, and designated contacts were sent a link to this platform. They were also sent a copy of the report compiled from their responses to the 2018 survey so that data that remained unchanged between years could be readily copied into the web survey. Designated contacts were given technical instructions for filling out the survey.

The online survey was available for completion by the states in the second week of April 2019. Telephone and online technical support were available to state survey contacts while the survey was in the field. Liquor law enforcement specialists provided review and support for any questions pertaining specifically to enforcement.

As with all STOP Act State Surveys since 2011, responses were received from all 50 states and the District of Columbia—a 100 percent response rate. Each state’s response was reviewed and state contacts were queried when necessary about apparent omissions, ambiguities, or other content issues. Copyedited reports of survey responses were returned to each state by email.

---

35 Questions about media campaigns were added to the 2019 STOP Act Survey.

36 One state was unable to provide current data on their enforcement efforts and thus requested that enforcement data reported in the 2018 survey be used for the 2019 response. These data were not used in the current data analysis.
States provided any requested clarifications and either approved the proposed copyedits or submitted their own revised text/information.

Results

Individual State Reports (see individual state summaries on stopalcoholabuse.gov) present all survey data submitted by each state. This section provides summary information about all variables amenable to quantitative analysis. It is important to keep in mind that each state determined how much information to provide, and that the range of information respondents provided was highly variable.

Results are grouped under five broad headings:
1. Enforcement Programs
2. Programs Targeted to Youth, Parents, and Caregivers
3. Collaborations, Planning, and Reports
4. Media Campaigns
5. State Expenditures on the Prevention of Underage Drinking

Comparison of Enforcement Data: 2011–19

The final section—Comparison of Enforcement Data: 2011–19—compares state survey data submitted for selected activities in the years 2011–19. It should be noted that less than half of the states reported data for all years. This section should be viewed with these cautions in mind.

In all cases, where numerical estimates are reported, the reporting period is the most recent 12-month period for which complete data were available to the state. Average values are reported as medians. The median is the numerical value separating the higher half of a sample from the lower half and is the best representation of the “average” value when (as is often the case with state survey responses) the data include outliers (a data point that is widely separated from the main cluster of data points in a dataset).

Enforcement Programs

The STOP Act State Survey requested enforcement data\(^{37}\) in four areas:
1. State enforcement efforts to prevent underage access to alcohol at retail outlets, such as compliance checks and shoulder tap operations.
2. Local enforcement efforts to prevent underage access to alcohol.
3. Enforcement of selected state laws aimed at deterring underage drinking (e.g., MIP laws and laws prohibiting Internet sales and direct shipment of alcohol).
4. Penalties (i.e., fines, license suspensions, and revocations) imposed on retail establishments for violation of these laws.

Exhibit 3.1 shows the percentage of states that collect data on compliance checks, MIP charges, and penalties levied against retail establishments for furnishing alcohol to minors. As illustrated in Exhibit 3.1, a majority of states collect this data. However, the number of states that collect data on local enforcement efforts is limited. Thus, it is likely that the enforcement

\(^{37}\) For charts showing individual state responses to all enforcement program questions on the 2019 State Survey, see the Supplementary Materials available on stopalcoholabuse.gov.
statistics provided here underestimate the total amount of underage drinking enforcement occurring in the states.

**Compliance Checks**

Compliance checks (or decoy operations) are defined as those enforcement actions in which trained underage (or apparently underage) operatives (“decoys”)—working with law enforcement officials—enter retail alcohol outlets and attempt to purchase alcohol. States were asked to provide an estimate of the total number of retail licensees in their state so that the percentage of licensees checked annually could be measured. A median of 17 percent of licensed establishments are checked across all 39 states that conduct compliance checks and collect associated data.38

Exhibit 3.2 provides a state-by-state picture of the percentage of licensees checked. Fifty-nine percent of those states conducting checks tested 20 percent or fewer of their licensees, indicating that checking is generally not comprehensive. The majority (85 percent) of states reported that checks were conducted at both on- and off-premises establishments.

In addition to questions about the number of state checks and the number of outlets that failed the checks, states were asked whether they conduct random compliance checks. Of the 40 states that conduct and collect data on compliance checks, 88 percent indicated that some or all of the checks conducted were done randomly, as opposed to being conducted in response to a complaint or as part of a convenience sample. For 61 percent of the states that report conducting random checks, all state checks were conducted randomly.

---

38 One state that conducts compliance checks and collects data on these checks did not provide sufficient information to calculate the percentage of all licenses checked.
Exhibit 3.2: Percentage of Licenses Checked by State

Source: STOP Act State Survey, 2019

Exhibit 3.3 compares the number and failure rates of all state compliance checks, those state checks conducted randomly, and local compliance checks. Thirteen states also collected data on compliance checks conducted by local law enforcement. Eleven states report conducting and collecting data for both state and local compliance checks; 42 states conduct and collect data on either state or local compliance checks; and 9 states conduct neither state nor local checks. As shown in Exhibit 3.3, the number of licensees checked and licensee failures varies widely.

Exhibits 3.4 and 3.5 provide state-by-state licensee failure rates for all compliance checks conducted by state and local agencies based on data reported by the states. Most state-level checks report failure rates of 20 percent or less, with seven states reporting higher rates.

Note: The “n” figures in this exhibit differ from the total numbers of states that answered “yes” to collecting and conducting random, and local compliance checks because some states provided incomplete data.

Source: STOP Act State Survey, 2019

Exhibit 3.4: State Compliance Checks Failure Rate

Source: STOP Act State Survey, 2019
Exhibit 3.5 highlights the lack of data on local compliance checks for most states. Only eleven states reported any data, and 91 percent of those states reported failure rates of 20 percent or less.

As noted above, there is great variation among the states in the percentage of the total number of outlets checked during this period. Some states indicated that they make multiple checks on single outlets during the year in question, and this may be true of other states. Compliance check protocols also vary by state. For example, states use differing procedures and requirements for choosing underage decoys (see Compliance Check Protocols, Chapter 1).

States may also conduct compliance checks randomly in response to complaints or as a result of a previous compliance check failure. Hence, differences in compliance check protocols may affect the number of outlets checked, the frequency of checks at a particular establishment, and the failure rates.

**Exhibit 3.5: Local Compliance Checks Failure Rate**

**Other Enforcement Strategies**

States were asked to report on four other state and local strategies to enforce underage drinking laws: Cops in Shops, shoulder tap operations, party patrol operations or programs, and underage alcohol-related fatality investigations. Definitions of these enforcement strategies follow.
An expanded discussion of these strategies is found in Chapter 2:

1. **Cops in Shops**: A well-publicized enforcement effort in which undercover law enforcement officers are placed in retail alcohol outlets.

2. **Shoulder tap operations**: Trained young people (decoys) approach individuals outside of retail alcohol outlets and ask them to make an alcohol purchase.

3. **Party patrol operations or programs**: Operations that identify underage drinking parties, make arrests and issue citations, and safely disperse participants.

4. **Underage alcohol-related fatality investigations**: Investigations to determine the source of alcohol ingested by fatally injured minors.

As shown in Exhibit 3.6, the most common enforcement activities at both state and local levels are party patrol operations or programs and underage alcohol-related fatality investigations.

Exhibit 3.7 displays states that implement one to four of the strategies listed in Exhibit 3.6. Exhibit 3.8 displays states in which local law enforcement agencies implement one to four of the strategies.
Exhibit 3.7: Number of Enforcement Strategies Implemented by States

All states regulate or prohibit direct sales and direct shipment of alcohol from producers to consumers, typically through Internet orders and delivery by common carriers. (Note: These laws do not address home delivery or Internet sales by retailers.) States were asked whether they have a program to investigate and enforce direct sales or direct shipment laws and whether these laws are also enforced by local law enforcement agencies. Exhibit 3.9 shows that 69 percent of the states report having direct shipment enforcement programs, but only 10 percent report that local law enforcement enforces these laws.

Sanctions Imposed on Retail Establishments for Violations

The State Survey requested information on penalties imposed on retail establishments for furnishing to minors (see Exhibits 3.10–3.14; note that the “n” figures in these exhibits differ from the total number of states that answered “yes” to collecting data on fines, suspensions, and revocations because some states provided incomplete data).

As would be expected, fines are the most common sanction, imposed about six times as often as suspensions. However, revocations are rare. Of the states that collect data on revocations, 69 percent revoked one or no licenses. Eighty-eight percent of the states revoked fewer than six licenses.

*Source: STOP Act State Survey, 2019*
The survey asked states to report the lowest and highest fine imposed and the shortest and longest number of suspension days. Exhibits 3.11–3.14 illustrate the great variation among the states in the amount of fines and the length of license suspensions imposed.

Sanctions for furnishing to minors can be put into perspective by considering rates per 100,000 drinking occasions among youth who are 16–20 years old. Exhibit 3.15 presents these rates for 24 states that collect complete sanctions data (i.e., fines, suspensions, and revocations).

### Minor in Possession Offenses

States were also asked to provide statistics on MIP offenses. As noted earlier, arrest data for MIP offenses provide an index of the enforcement of laws designed to deter underage persons from drinking. Some states reported data that included arrests/citations issued by local law enforcement agencies; others did not.

The first three rows of Exhibit 3.16 present the number of MIP arrests/citations reported by all states that collect such data. These data may not provide an accurate picture of MIP enforcement
as much of this enforcement is conducted at the local level and, therefore, is not represented in state data. The last three rows of Exhibit 3.16 present data only from those states that collect both state and local MIP data. When only those states that collect local data are considered, the median number of arrests/citations increases by 62 percent, highlighting the importance of local enforcement efforts and data.

<table>

<td>3,596</td>
<td>10,170</td>
</tr>
</tbody>
</table>

Source: STOP Act State Survey, 2019

To explore the meaning of these data, two indices were calculated for states with both state and local MIP enforcement (Exhibit 3.17). The first index compares the rates of MIP arrests/citations with an estimate of yearly drinking occasions among 16- to 20-year-olds. The second index reflects arrests per 100,000 youth in each state who are 16–20 years old.

Sanctions Against Youth Versus Sanctions Against Retailers

A comparison of the rates of MIP arrests versus the rates of retailer sanctions (i.e., totals of fines, suspensions, and revocations) highlights enforcement priorities. Seventeen states provided the complete dataset needed for this analysis (Exhibit 3.18).

39 This estimate is based on the calculations of Wagenaar and Wolfson (1994). Using Monitoring the Future data, they estimated a rate of 90 drinking occasions per 100 youth per month. To maintain consistency of analysis over the years, this formula is used in every year’s survey analysis.
In most states, MIP arrests greatly outnumber retailer sanctions, indicating that priority is given to individual arrests over enforcement at the retail level. The ratio of MIP arrests to retailer sanctions (indicating a priority on retailer enforcement) was less than one in five states.

### Programs Targeted to Youth, Parents, and Caregivers

States were asked to list general prevention programs that have underage drinking as one objective and are funded or operated directly by the state. The survey provided space for detailed descriptions of up to 10 programs, plus additional space to briefly list any other programs that the states wanted to highlight.

States were also asked:
1. The number of youth, parents, and caregivers served by each program (if the program was aimed at a specific, countable population).
2. Whether the program has been evaluated.
3. Whether an evaluation report is available and where the report can be found.

Specific populations served were defined as follows:
- **Youth**: People younger than 21 years old.
- **Parents**: People who have primary responsibility for the well-being of a minor (e.g., biological and adoptive parents, grandparents, foster parents, extended family).
- **Caregivers**: People who provide services to youth (e.g., teachers, coaches, healthcare and mental healthcare providers, human services and juvenile justice workers).

In addition to program descriptions, states were asked whether they had programs to measure and reduce youth exposure to alcohol advertising and marketing and best-practice standards for selecting or approving underage drinking programs.

### Program Content

States varied widely in the number of programs described, in part because some states provided detailed information on local variations of some program types (e.g., community coalitions) whereas others described umbrella programs. Many well-known programs were reported, including those focused on life skills, refusal skills, media advocacy, community organizing, and environmental change. Prevention initiatives developed by individual states were also well represented.
The types of programs states are implementing were coded into one of four categories:

1. **Programs focused on individuals**—Including programs designed to impart knowledge, change attitudes and beliefs, or teach skills. These programs focus on individual youths or adults (usually parents) but are almost always conducted with groups (e.g., classrooms, Boys & Girls Clubs, parent–teacher associations, members of a congregation). Also in this category are programs for offenders (e.g., youth charged with MIP or driving while intoxicated). Certain kinds of education and skills development were considered part of the environment, including training for alcohol sellers and servers, healthcare workers, public safety personnel, and others whose activities affect large numbers of people.

2. **Programs focused on the environment**—Including programs that seek to alter physical, economic, and social environments which may be focused on entire populations (e.g., everyone in a state or community) or a subpopulation (e.g., underage people, youth who drive). The main mechanisms for environmental change include state laws and local ordinances and their enforcement; institutional policies (e.g., enforcement priorities or prosecutorial practice, how alcohol is to be served at public events, carding everyone who looks younger than 35 years old, alcohol screening of all emergency room injury admissions); and changing norms. These changes are generally designed to decrease physical availability of alcohol (e.g., home delivery bans, retailer compliance checks), raise economic costs (e.g., drink special restrictions, taxation), and limit social availability (e.g., policies that affect the extent to which alcohol and alcohol users are visible in the community, such as banning alcohol in public places and at community events or banning outdoor alcohol advertising).

3. **Mixed**—Includes programs where both individual and environmental approaches are a substantive part of the effort. Comprehensive prevention programs are a relevant example. Comprehensive prevention programs involve the achievement of multiple goals while engaging the community, family, and social environment.

4. **Media campaigns**—Includes campaigns conducted through television, radio, social media, and websites to provide information about underage drinking, promote social norms that discourage underage drinking, and increase awareness of underage drinking policies (e.g., social host laws). Media campaigns are often directed to specific audiences, including parents or college students, as well as to the general public.

In total, 300 programs (87 percent of all programs) were described in sufficient detail to allow coding. Results are presented in Exhibit 3.19. As shown, programs focused on individuals were twice as common as programs focused on the environment. States tended to adopt either individual or environmental approaches in the programs they described, and 52 percent of the states that reported any programs that could be coded focused exclusively on one or the other.

Numbers Served

States were asked to estimate the number of youths, parents, and caregivers served by programs aimed at specific populations. These data were incomplete, with 57 percent of the states \((n=29)\) providing data for at least one program for youths served; 35 percent \((n=18)\) for parents served; and 25 percent \((n=13)\) for caregivers served. These data may be difficult for certain types of programs to estimate. In particular, the target populations for programs focused on the environment may be entire populations or subpopulations. Estimating the actual numbers reached is therefore problematic. Exhibit 3.20 provides the reported number of youths, parents, and caregivers served across all states that reported data.

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

*Maximum numbers served are high in those instances where states reported that a program served the entire state population or in those instances in which individuals may be served by the program multiple times.

Source: STOP Act State Survey, 2019

Evaluation Data

For each program, states were asked whether the program had been evaluated and if an evaluation report was available. Summary data for these questions appear in Exhibit 3.21. (Note: Data should be viewed with the caveat that evaluation data were not reported for 28 percent of all programs.)

Programs to Measure and Reduce Youth Exposure to Alcohol Advertising and Marketing

States were asked whether they have programs to measure or reduce youth exposure to alcohol advertising and marketing. Forty-three percent \((n=22)\) of the states reported they had such programs, which tend to implement four approaches:

1. Environmental scans to assess the degree of youth exposure to alcohol advertising.
2. Counter-advertising initiatives.
3. Eliminating environmental advertising aimed at youth.
4. Social marketing.
Best-Practice Standards

States were asked whether they have adopted or developed best-practice standards for underage drinking prevention programs and, if so, the type of agency or organization that established the standards. Ninety percent (n=46) reported they had best-practice standards. As shown in Exhibit 3.22, federal agencies play a significant role in their establishment, followed by state agencies. Sixty-three percent of those states with best-practice standards reported that more than one type of agency was responsible for their establishment. Close to three-quarters (74 percent) included SAMHSA and CSAP in their list of agencies.

Collaborations, Planning, and Reports

The STOP Act Survey included two questions about collaborations. The first question asked whether states collaborated on underage drinking issues with federally recognized tribal governments (if any). Fifty-three percent (n=26) said they did collaborate, 20 percent said they did not collaborate, and the remainder reported no federally recognized tribes in their states.

The second question asked whether states had a state-level interagency body or committee to coordinate or address underage drinking prevention activities. Seventy-one percent of the states reported that such a committee exists, although the composition of the committee varied somewhat from state to state. Most states’ interagency committees included a variety of state agencies directly involved in underage drinking prevention policy implementation and enforcement, as well as educational and treatment program development and oversight. These include the states’ departments of health and human services and alcohol beverage control, their substance misuse agency, and their state police/highway patrol.

Of interest is the extent to which the committees included representatives from the governor’s office, state legislature, and office of the attorney general, given that these individuals and offices are so critical in setting priorities, providing funding, and generating political and public support. Exhibit 3.23 shows that 11 percent of the states with a committee included the governor, 11 percent included a legislative representative, and one in five included an attorney general.

Exhibit 3.23: Composition of the Interagency Group—State Government Entities

States were asked whether they had prepared a plan for preventing underage drinking or issued a report on underage drinking in the past 3 years. Fifty-five percent of the states had prepared a plan, and 49 percent had issued a report. The majority of states provided a source for obtaining the plans or reports (see individual state reports).

**Media Campaigns**

The 2019 survey contained a new series of questions about state participation in media campaigns and other social marketing efforts intended to reduce underage drinking and increase parent–child communications about alcohol consumption. As described in Chapter 2, media campaigns have been shown to enhance efforts to reduce underage drinking and increase perception of the enforcement of underage drinking laws. States were asked whether or not they participated in or collaborated with a media campaign to prevent underage drinking. Three-quarters (75 percent) of the states indicated that they did participate in such a campaign. When asked what types of media campaign the states participated in, regional and local campaigns were the most popular, followed by federal campaigns (see Exhibit 3.25).

States were specifically asked about their participation in SAMHSA’s national media campaign, “Talk. They Hear You.” (TTHY). Seventy-six percent responded that they did, indicating that they may think of it as more of a state campaign once adopted rather than as a federal campaign. States participating in TTHY were asked to describe how they participated and which resources they devoted to the TTHY campaign. As indicated in Exhibit 3.26, the majority of states forward TTHY materials to local areas. However, few states procure funding for TTHY (see Exhibit 3.27).

**State Expenditures on the Prevention of Underage Drinking**

States were asked to estimate state expenditures for two categories of enforcement activities and five types of programs targeted to youth, parents, and caregivers. Exhibit 3.28 provides the data in $1,000 units reported for: (1) Enforcement activities, (2) program activities, and (3) other activities. An entry of zero in the “Minimum reported” row means that at least one state that maintains data reported no expenditures in that category.

---

40 The state survey asks about expenditures only from state budget sources. Federal block grants and other federal funds make up approximately 80 percent of state substance misuse prevention expenditures.

</table>

†These data must be viewed cautiously. Response rates ranged from 27 percent to 85 percent. Thus, the extent to which some of these data reflect national trends is unclear.

*The median is zero if more than half the responses are zero.

Source: STOP Act State Survey, 2019

The largest expenditure category is for community-based programs, followed by K–12 school programs. The median of expenditures for programs targeted to youth, parents, and caregivers ($134,206) is twice that for all enforcement activities (median = $59,607), and the total dollar amount expended for these nonenforcement programs ($148,033,549) is 16 times the total dollar amount spent on enforcement ($9,322,436).

States were also asked whether funds dedicated to underage drinking are derived from taxes, fines, and fees. Eighty-eight percent of the states provided data for these questions. The use of these funding sources for underage drinking prevention activities is limited (see Exhibit 3.29).

Comparison of Enforcement Data: 2011–19

The STOP Act State Survey is now in its ninth year of data collection. Exhibits 3.30–3.40 offer a snapshot of the results for 2011–19 for several key components of enforcement data.

Data collection and reporting vary greatly from year to year among the states, so it is not possible to compare all states over these 9 years. Fewer than half the states provided information in all 9 years for all datasets.41

The following exhibits present two ways of looking at each enforcement variable. Data reported in the initial table (or tables) represents only those states that reported information for that variable in all 9 years of the survey. The second chart shows median data for that variable by survey year, including all states that reported in each year of the survey. Caution should be used in interpreting these data.

Minors in Possession Data: 2011–19

Eighteen percent of the states provided MIP data over all 9 years. As shown in Exhibit 3.30, of these states, 100 percent reported a smaller number of MIP arrests in 2019 than in 2011. Increases and decreases in the number of arrests were not continuous over the 9 years. For all the states, there was some variation across the years.

Exhibit 3.31 shows the median number of MIP arrests reported by all states over the 9-year period, contrasting the median number of arrests reported by those states that included local arrest data with data from all states. The median number of arrests for those states including local data remained consistently higher than for that of all states, again demonstrating the importance of local enforcement efforts and data. These data also reflect the general trend shown in Exhibit 3.27, with lower median numbers of arrests reported in 2019 than in 2011.

States not reporting in all 9 years (n=42)

Source: STOP Act State Survey, 2011–19

41 For detailed charts of all state enforcement data reported from 2011–19, see the Supplementary Materials available on stopalcoholabuse.gov.
State Compliance Checks Data: 2011–19

Exhibit 3.32 indicates that 45 percent of the states provided state compliance check data for all 9 years. Sixty-one percent of the states reported an increased number of compliance checks between 2011 and 2019, and 39 percent reported a decreased number. As with MIP arrests, increases and decreases are not continuous across the years; all states reported some fluctuation.\(^\text{42}\)

Exhibit 3.33 shows the median number of state compliance checks reported by all states over the 9-year survey period. The reduction in the number of states reporting compliance checks data over all 9 years indicates that these data should be viewed with caution.

---

\(^\text{42}\) In previous reports, a comparison of local compliance check data was included. As only two states reported these data for all 9 years (2011–19), a meaningful comparison is not possible. Similarly, a comparison of state expenditures for compliance checks is not included, as only one state has reported these data for all 9 years.
Chapter 3: Enforcement And Prevention Activities—2019 State Survey Results

Retailer Sanctions Data: 2011–2019

Exhibits 3.34–3.36 describe state reporting on penalties for retail establishments between 2011 and 2019. With the exception of fines, larger percentages of the states reported reduced use of these penalties than reported increased use. Given that revocations are relatively infrequent, it is not surprising that 30 percent of all states reporting showed no change between 2011 and 2019. Taking into account the variation in reporting rates for all 9 years (10 percent to 20 percent of all states), as well as the fact that fewer states are providing data over the 9-year period, these data should be viewed with caution.
Exhibit 3.37 shows the median number of sanctions reported by all states between 2011 and 2019. Fines are the most common sanction, and revocations are rare. As with the dataset above, the revocations median remains zero across all years; the large majority of states report one or zero revocations each year.

### Exhibit 3.37: Median Retailer Sanctions for Furnishing Alcohol to Underage Persons 2011–2019

![Graph showing median retailer sanctions for furnishing alcohol to underage persons 2011–2019](image)

### Data Collection Patterns 2011–2019

As noted previously, these figures should be viewed with the caveat that numbers reported are impacted by variations in the availability and collection of data. Exhibits 3.38 and 3.39 demonstrate the variability in data collection on key enforcement variables by all states between 2011 and 2019. Fewer states reported that they collected state and local compliance check and MIP arrest data in the 2019 survey than in the 2011 survey. By contrast, collection of sanctions data (i.e., fines, suspensions, and revocations) has remained relatively consistent, ranging from about 70 percent to 80 percent, as shown in Exhibit 3.40.
Chapter 3: Enforcement And Prevention Activities—2019 State Survey Results

Exhibit 3.38: State and Local Compliance Checks: Percentage of States Collecting Data 2011–2019

A key conclusion to be drawn from the STOP Act State Survey is that all 50 states and the District of Columbia have demonstrated a commitment to the reduction of underage drinking and its consequences. This commitment is evident in the fact that all states completed the survey, reported numerous program activities, and in many cases provided substantial detail about those activities (see individual state summaries in stopalcoholabuse.gov).

Completion of the lengthy survey requires the cooperation of multiple state agencies, including those charged with enforcement of underage drinking laws and policies and those involved in prevention of underage consumption. The 100 percent response rate over the 9 years of the survey’s existence shows the states’ dedication to the task of preventing underage drinking.

Although data provided by the state survey are informative and useful, it should be noted that enforcement activities appear highly variable across the states. Compliance checks and other enforcement activities related to furnishing (i.e., party patrol operations, underage alcohol-related fatality investigations, and enforcement of direct-shipment laws) are fairly widely implemented, although not necessarily at both the state and local levels. However, the total number of checks is modest. Fifty-nine percent of those states conducting checks test 20 percent or fewer of their licensees. Sanctions for furnishing are predominantly fines, which are six times more common than suspensions. Revocations are extremely rare; 69 percent of the states revoked one or no licenses.

As demonstrated in Exhibits 3.38 and 3.39, some of the variability found in enforcement data may be due as much to data unavailability as to whether the activities were actually conducted.
The number of states that collect data on local enforcement efforts is limited. Given that enforcement of laws on furnishing minors and MIP also occurs at the local level, it is likely that the enforcement statistics reported here actually underestimate the total amount of underage drinking enforcement occurring in the states. Regular and complete collection of both state and local enforcement data is critical to building an accurate picture of the national effort to prevent underage drinking.
CHAPTER 4
State Performance Measures
CHAPTER 4: STATE PERFORMANCE MEASURES

Introduction

This chapter shows how the states compare to national averages for six key measures:
1. Percentage of 12- to 20-year-olds who used alcohol in the last month.
2. Percentage of 12- to 20-year-olds who binge drank alcohol in the last month.
3. Percentage of 12- to 17-year-olds who perceive drinking five or more alcoholic beverages once or twice a week as not a great risk.
4. Percentage of 12- to 17-year-olds meeting the criteria for a *Diagnostic and Statistical Manual of Mental Disorders*, Fourth Edition (DSM-IV) alcohol use disorder in the past year.
5. Percentage of 12- to 17-year-olds needing but not receiving treatment for an alcohol use disorder at a specialty facility in the past year.
6. Percentage of traffic crash deaths involving a 15- to 20-year-old driver in which that driver had a blood alcohol content (BAC) of 0.01 or higher.

These measures (except for Measures 3 and 5) have been identified by the Interagency Coordinating Committee on the Prevention of Underage Drinking as significant for purposes of evaluating progress in underage drinking prevention in the *2018 Report to Congress on the Prevention and Reduction of Underage Drinking*. Each measure is based on data collected by the federal government.

Although Measures 1–5 and the State Reports both incorporate state-specific data from the Substance Abuse and Mental Health Services Administration’s National Survey on Drug Use and Health (NSDUH) on past-month underage alcohol use and binge use, they draw on different years of data. Measures in this chapter are based on data from 2017 and 2018. Profiles in the State Reports average data from the past 4 years (2015–2018) for greater sample size to obtain accurate estimates by age for 12- to 14-year-olds, 15- to 17-year-olds, and 18- to 20-year-olds.

This chapter is not intended to provide a comprehensive ranking of the states’ performance in preventing and reducing underage drinking. Caution should be used in interpreting these charts, as a wide variety of factors may influence the data for a given state. In some cases, the total number of cases was low—for example, traffic crash fatalities in low-population states. When available, calculations were performed to determine whether a state’s variation from the national average was statistically significant. These six measures may provide a useful starting point for state officials and engaged community members who seek to improve outcomes and wish to engage in planning for effective interventions.

43 DSM-IV criteria for alcohol use disorder are used in the NSDUH, which is the source of the data for this performance measure.
